NEC

MOS INTEGRATED CIRCUIT
µPD481850 for Rev.L

8 M-BIT SYNCHRONOUS GRAM
128K-WORD BY 32-BIT BY 2-BANK

Description

The µPD481850 is a synchronous graphics memory (SGRAM) organized as 131,072 words × 32 bits × 2 banks random access port.

This device can operate up to 100 MHz by using synchronous interface. Also, it has 8-column Block Write function to improve capability in graphics system.

This product is packaged in 100-pin plastic QFP (14 × 20 mm).

Features

- 131,072 words × 32 bits × 2 banks memory
- Synchronous interface (Fully synchronous DRAM with all input signals are latched at rising edge of clock)
  : Pulsed interface
  : Automatic precharge and controlled precharge commands
  : Ping-pong operation between the two internal memory banks
  : Up to 100 MHz operation frequency
- Possible to assert random column address in every cycle
- Dual internal banks controlled by A9 (Bank Address: BA)
- Byte control using DQM0 to DQM3 signals both in read and write cycle
- 8-column Block Write (BW) function
- Persistent write per bit (WPB) function
- Wrap sequence : Sequential / Interleave
- Programmable burst length (1, 2, 4, 8 and full page)
- Programmable /CAS latency (2 and 3)
- Power Down operation and Clock Suspend operation
- Auto refresh (CBR refresh) or self refresh capability
- Single 3.3 V ± 0.3 V power supply
- LVTTL compatible inputs and outputs
- 100-pin Plastic QFP (14 × 20 mm)
- 1,024 refresh cycles/16 ms
- Burst termination by Precharge command
- Burst termination by Burst stop command (in case of full page burst)

Ordering Information

Block Diagram

CONTENTS

1. Input/Output Pin Function

Pin name	Input/Output	Function
CLK	Input	CLK is the master clock input. Other inputs signals are referenced to the CLK rising edge.
CKE	Input	CKE determine validity of the next CLK (clock). If CKE is high, the next CLK rising edge is valid; otherwise it is invalid. If the CLK rising edge is invalid, the internal clock is not asserted and the μPD481850 suspends operation. When the μPD481850 is not in burst mode and CKE is negated, the device enters power down mode. During power down mode, CKE must remain low. In Self refresh mode, low level on this pin is also used as part of the input command to specify Self refresh.
/CS	Input	/CS low starts the command input cycle. When /CS is high, commands are ignored but operations continue.
/RAS, /CAS, /WE	Input	/RAS, /CAS and /WE have the same symbols on conventional DRAM but different functions. For details, refer to the command table.
DSF	Input	DSF is part of the inputs of graphics command of the μPD481850. If DSF is inactive (Low level), μPD481850 operates as same as SDRAM.
A0 - A8	Input	Row Address is determined by A0 - A8 at the CLK (clock) rising edge in the activate command cycle. Column Address is determined by A0 - A7 at the CLK rising edge in the read or write command cycle. A8 defines the precharge mode. When A8 is high in the precharge command cycle, both banks are precharged; when A8 is low, only the bank selected by A9 is precharged. When A8 is high in read or write command cycle, the precharge starts automatically after the burst access.
A9		A9 is the bank address signal (BA). In command cycle, A9 low selects bank A and A9 high selects bank B.
DQM0 - DQM3	Input	DQM controls I/O buffers. DQM0 corresponds to the lowest byte (DQ0 to DQ7), DQM1 corresponds to DQ8 to DQ15, DQM2 corresponds to DQ16 to DQ23. DQM3 corresponds to DQ24 to DQ31. In read mode, DQM controls the output buffers like a conventional /OE pin. DQM high and DQM low turn the output buffers off and on, respectively. The DQM latency for the read is two clocks. In write mode, DQM controls the word mask. Input data is written to the memory cell if DQM is low but not if DQM is high. The DQM latency for the write is zero.
DQ0 - DQ31	Input/Output	DQ pins have the same function as I/O pins on a conventional DRAM. These are normally 32-bit data bus and are used for inputting and outputting data. • Function as the mask data input pins in the special register set command. Write operations can be performed after Active command with WPB (old mask data). • Functions as the column selection data input pin in the block write cycle.
V$_{CC}$ V$_{SS}$ V$_{CC}$Q V$_{SS}$Q	(Power supply)	V$_{CC}$ and V$_{SS}$ are power supply pins for internal circuits. V$_{CC}$Q and V$_{SS}$Q are power supply pins for the output buffers.

2.   Commands

Mode register set command

(/CS, /RAS, /CAS, /WE, DSF = Low)

The µPD481850 has a mode register that defines how the device operates. In this command, A0 through A9 are the data input pins.   After power on, the mode register set command must be executed to initialize the device.

The mode register can be set only when both banks are in idle state.

During 2 CLK (tRSC) following this command, the µPD481850 cannot accept any other commands.

Refer to **6. Programming the Mode Register**.

Fig.1   Mode register set command
Bank activate command

(/CS, /RAS, /DSF = Low, /CAS, /WE = High)

The µPD481850 has two banks, each with 512 rows.

This command activates the bank selected by A9 (BA) and a row address selected by A0 through A8.

This command corresponds to a conventional DRAM's /RAS falling.

Fig.2   Row address strobe and bank activate command
Bank activate command with WPB enable

(/CS, /RAS = Low, /CAS, /WE, /DSF = High)

This command is same as Bank activate command.   After this command, write per bit function is available.   Mask register's data is used as write mask data.

Refer to **12. Write/Block Write with Write Per Bit**.

Fig.3   Row address strobe and bank activate command with WPB enable
Precharge command

(/CS, /RAS, /WE, DSF = Low, /CAS = High)

This command begins precharge operation of the bank selected by A9 (BA) and A8. When A8 is High, both banks are precharged, regardless of A9. When A8 is Low, only the bank selected by A9 is precharged. A9 low selects bank A and A9 high selects bank B.

After this command, the μPD481850 can't accept the activate command to the precharging bank during t_{RP} (precharge to activate command period). This command can terminate the current burst operation (2, 4, 8, full page burst length).

This command corresponds to a conventional DRAM's RAS rising. Refer to **10. Precharge** and **11. Auto Precharge**.

Fig.4 Precharge command
Write command

(/CS, /CAS, /WE, DSF = Low, /RAS = High)

If the mode register is in the burst write mode, this command sets the burst start address given by the column address to begin the burst write operation. The first write data must be input with this write operation. The first write data in burst mode can input with this command with subsequent data on following clocks.

Fig.5 Column address and write command
Read command

(/CS, /CAS, DSF = Low, /RAS, /WE = High)

This command sets the burst start address given by the column address. Read data is available after /CAS latency requirements have been met.

Fig.6 Column address and read command
CBR (auto) refresh command

(/CS, /RAS, /CAS, DSF = Low, /WE, CKE = High)

This command is a request to begin the CBR refresh operation.   The refresh address is generated internally.

Before executing CBR refresh, both banks must be precharged.

After this cycle, both banks will be in the idle (precharged) state and ready for a bank activate command.

During t_{RC} period (from refresh command to refresh or activate command), the μPD481850 cannot accept any other command.

Fig.7 CBR (auto) refresh command
Self refresh entry command

(/CS, /RAS, /CAS, DSF, CKE = Low, /WE = High)

After the command execution, self refresh operation continues while CKE remains low.   When CKE goes high, the μPD481850 exits the self refresh mode.

During self refresh mode, refresh interval and refresh operation are performed internally, so there is no need for external control.

Before executing self refresh, both banks must be precharged.

Fig.8 Self refresh entry command
Burst stop command in full page

(/CS, /WE, DSF = Low, /RAS, /CAS = High)

This command can stop the current full page burst (BL = 256) operation. If BL is set to 2, 4, 8, to execute this command is Nop.

Refer to **14. Read/Write Command Interval** and **15. Burst Termination**.

Fig.9 Burst stop command in Full Page Mode
No operation

(/CS, DSF = Low, /RAS, /CAS, /WE = High)

This command is not a execution command. No operations begin or terminate by this command.

Fig.10 No operation

Special register set command

(/CS, /RAS, /CAS, /WE = Low, DSF = High)

The µPD481850 has two special registers for graphics commands.   One is color register and the other is mask register.   In this command, A0 through A9 are the data input pins for the register select (color or mask register).   DQ0 through DQ31 are the data input pins for the Color data or the WPB data.

During 2 CLK (t$_{RSC}$) following this command, the µPD481850 can not accept any other commands.

Refer to **8. Programming the Special Register**.

Notes 1. All entries assume that CKE was active (High level) during the preceding clock cycle.

2. If both banks are idle, and CKE is inactive (Low level), µPD481850 will enter Power down mode. All input buffers except CKE will be disabled.

3. Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address (BA), depending on the state of that bank.

4. If both banks are idle, and CKE is inactive (Low level), µPD481850 will enter Self refresh. All input buffers except CKE will be disabled.

5. Illegal if t$_{RCD}$ is not satisfied.

6. Illegal if t$_{RAS}$ is not satisfied.

7. Must satisfy burst interrupt condition.

8. Must satisfy bus contention, bus turn around, and/or write recovery requirements.

9. Must mask preceding data which don't satisfy t$_{DPL}$.

10. Illegal if t$_{RRD}$ is not satisfied.

11. Nop to bank precharging or in idle state. May precharge bank(s) indicated by BA (and A8).

12. Illegal if any bank is not idle.

Remark H = High level, L = Low level, x = High or Low level (Don't care), V = Valid Data input, BA = Bank address (A9), A8 = Precharge select, RA = Row address, CA = Column address, Term = Terminate, AP = Auto precharge, NOP = No operation, ILLEGAL = Device operation and/or data-integrity are not guaranteed

4.5 Command Truth Table for CKE

Current state	CKE		/CS	/RAS	/CAS	/WE	DSF	Address	Action	Notes
	n−1	n								
Self refresh (S.R.)	H	x	x	x	x	x	x	x	INVALID, CLK(n−1) would exit S.R.	
	L	H	H	x	x	x	x	x	S.R. Recovery

Notes 1. If the μPD481850 is in a state other than above listed in the "From State" column, the command is illegal.

2. The states listed under "To" might not be entered on the next clock cycle.

Timing restrictions apply.

Remark H = High level, L = Low level, x = High or Low level (Don't care),

BA = Bank address (A9)

State abbreviations

I = Idle

A = Bank active

R = Read with No precharge (No precharge is posted)

W = Write with No precharge (No precharge is posted)

RP = Read with auto precharge (Precharge is posted)

WP = Write with auto precharge (Precharge is posted)

Any = Any State

X0Y1 = Bank0 is in state "X", Bank1 = in state "Y"

(X/Y)0Z1 = Z1(X/Y)0 = Bank0 is in state "X" or "Y", Bank1 is in state "Z"

5. Initialization

The synchronous GRAM is initialized in the power-on sequence according to the following.

(1) To stabilize internal circuits, when power is applied, a 100 μs or longer pause must precede any signal toggling.

(2) After the pause, both banks must be precharged using the Precharge command (The Precharge all banks command is convenient).

(3) Once the precharge is completed and the minimum t_{RP} is satisfied, the mode register can be programmed. After the mode register set cycle, t_{RSC} (2 CLK minimum) pause must be satisfied as well.

(4) Two or more CBR (Auto) refresh must be performed.

Remarks 1. The sequence of Mode register programming and Refresh above may be transposed.

2. CKE and DQM may be held high until the Precharge command is asserted to ensure data-bus Hi-Z.

6. Programming the Mode Register

The mode register is programmed by the Mode register set command using address bits A9 through A0 as data inputs.   The register retains data until it is reprogrammed or the device loses power.

The mode register has four fields;

Options   : A9 through A7
/CAS latency   : A6 through A4
Wrap type   : A3
Burst length   : A2 through A0

Following mode register programming, no command can be asserted before at least 2 CLK (t_{RSC}) have elapsed.

/CAS Latency

/CAS latency is the most critical of the parameters being set.   It tells the device how many clocks must elapse before the data will be available.

The value is determined by the frequency of the clock and the speed grade of the device.   The table on page 51 shows the relationship of /CAS latency to the clock period and the speed grade of the device.

Burst Length

Burst Length is the number of words that will be output or input in a read or write cycle.   After a read burst is completed, the output bus will become Hi-Z.
The burst length is programmable as 1, 2, 4, 8 or full page (256 columns).

Wrap Type (Burst Sequence)

The wrap type specifies the order in which the burst data will be addressed.   The µPD481850 supports "Sequential mode" and "Interleave mode".

The table on the page 27 shows the addressing sequence for each burst length.

101	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
110	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
111	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

Full page burst is an extension of the above tables with the length being 256.

Preliminary Data Sheet

8. Programming the Special Register

The special register is programming by the Special register set command using address bits A9 through A0 and data bits DQ0 through DQ31.   The color and mask register retain data until it is reprogrammed or the device losed power.

The special register has four fields;

Reserved   : A9 through A7
Color register : A6
Mask register : A5
Reserved   : A4 through A0

Following special register programming, no command can be asserted before at least 2 CLK (t_{RSC}) have elapsed.
8.1 Color Register

Color register is used as write data in Block Write cycle.   In Special Register set command, if A5 is "0" and A6 is "1", the color register is selected.   And the data of DQ0 through DQ31 is stored to color register as color data (write data).
8.2 Mask Register

Mask register is used as write mask data in Write and Block Write cycle.   In Special Register set command, if A5 is "1" and A6 is "0", the mask register is selected.   And the data of DQ0 through DQ31 is stored to mask register as write mask data.

8.3 Special Register

9	8	7	6	5	4	3	2	1	0
0	0	0	LC	LM	0	0	0	0	0

Mask Register	Bits 5	Function
	0	Not Load
	1	Load

Color Register	Bits 6	Function
	0	Not Load
	1	Load

Remark   If LC and LM are both high (1), data of Mask and Color register will be unknown.

9.   Address Bits of Bank Address and Precharge

Row | A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | A8 | **A9** →

0	Select Bank A "Activate" command
1	Select Bank B "Activate" command

(Activate command)

| A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | **A8** | **A9** |

(Precharge command)

A8	A9	Result
0	0	Precharge Bank A
0	1	Precharge Bank B
1	x	Precharge All Banks

x : Don't care

0	disables Auto-Precharge (End of Burst)
1	enables Auto-Precharge (End of Burst)

Col. | A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 | **A8** | **A9** |

(/CAS strobes)

0	enables Read/Write commands for Bank A
1	enables Read/Write commands for Bank B

| **Precharge for Bank A**	**Precharge for Bank B**	**Precharge for All Banks**

10. Precharge

The precharge command can be asserted anytime after $t_{RAS(MIN.)}$ is satisfied.

Soon after the precharge command is asserted, precharge operation performed and the synchronous GRAM enters the idle state after t_{RP} is satisfied.   The parameter t_{RP} is the time required to perform the precharge.

The earliest timing in a read cycle that a precharge command can be asserted without losing any data in the burst is as follows.

/CAS latency = 2 or 3 : One clock earlier than the last read data.

Burst length=4

(t_{RAS} is satisfied)
In order to write all data to the memory cell correctly, the asynchronous parameter "t_{DPL}" must be satisfied.   The $t_{DPL(MIN.)}$ specification defines the earliest time that a precharge command can be asserted.   Minimum number of clocks are calculated by dividing $t_{DPL\ (MIN.)}$ with clock cycle time.

In summary, the precharge command can be asserted relative to reference clock that indicates the last data word is valid.   In the following table, minus means clocks before the reference; plus means time after the reference

/CAS latency	Read	Write
2	−1	+$t_{DPL(MIN.)}$
3	−1	+$t_{DPL(MIN.)}$

11. Auto Precharge

During a read or write/block write command cycle, A8 controls whether auto precharge is selected. A8 high in the read or write/block write command (Read with Auto precharge command or Write with Auto precharge command/Block Write with Auto precharge command), auto precharge is selected and begins after the burst access automatically.
When the t_{RAS} is not satisfied, the precharge does not start at above timing. And the precharge will start when the t_{RAS} is satisfied.

The clock that begins the auto precharge cycle is depend on both the /CAS latency programmed into the mode register and whether READ or WRITE/BLOCK WRITE cycle.

11.1 Read with Auto Precharge

When using auto precharge in READ cycle, knowing when the precharge starts is important because the next activate command to the bank being precharged cannot be executed until the precharge cycle ends. Once auto precharge has started, an activate command to the bank can be asserted after t_{RP} has been satisfied.
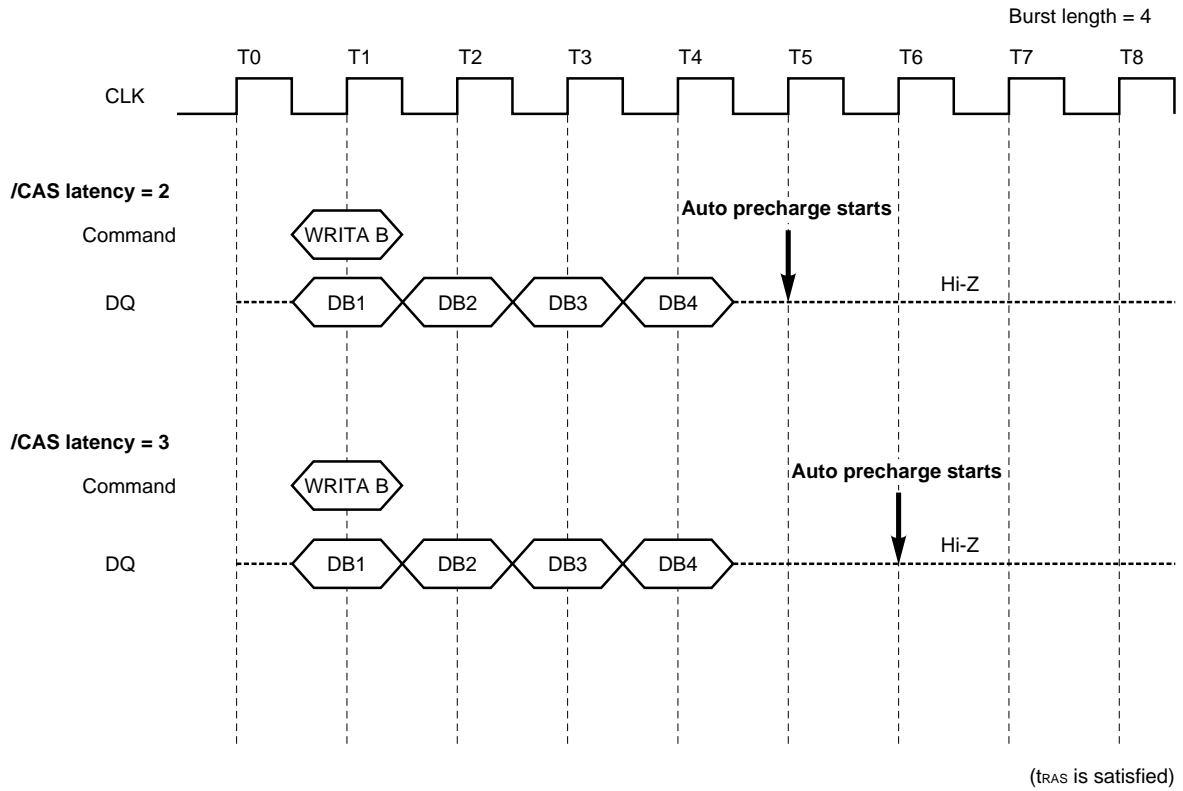

During READ cycle, the auto precharge begins after t_{RAS} and begins on the clock that indicates one clock earlier the last data word output during the burst is valid.

Burst length = 4

(t$_{RAS}$ is satisfied)

11.2 Write with Auto Precharge

In write cycle, the t_{DAL} must be satisfied to assert the all commands to the bank being precharged. And it is not necessary to know when the precharge starts. In block write cycle, the t_{BAL} must be satisfied to assert the all commands to the bank being precharged. And it is not necessary to know the precharge starts.

During WRITE cycle, the auto precharge begins after t_{RAS} and begins one clock after the last data word input to the device (/CAS latency of 2) or two clocks after (/CAS latency of 3).

Burst length = 4

| | T0 | T1 | T2 | T3 | T4 | T5 | T6 | T7 | T8 |

CLK

/CAS latency = 2

Command ⟨WRITA B⟩

Auto precharge starts

DQ ⟨DB1⟩⟨DB2⟩⟨DB3⟩⟨DB4⟩ Hi-Z

/CAS latency = 3

Command ⟨WRITA B⟩

Auto precharge starts

DQ ⟨DB1⟩⟨DB2⟩⟨DB3⟩⟨DB4⟩ Hi-Z

(t_{RAS} is satisfied)

11.3 Block Write with Auto Precharge

During BLOCK WRITE cycle, the auto precharge begins two clocks after the block write command to the device (/CAS latency of 2) or three clocks after (/CAS latency of 3).

(t_RAS is satisfied)
Remark CM : Column Mask

In summary, the auto precharge cycle begins relative to a reference clock that indicates the last data word is valid. In the table below, minus means clocks before the reference; plus means clocks after the reference.

/CAS latency	Read	Write	Block Write
2	−1	+1	+2
3	−1	+2	+3

12.   Write/Block Write with Write Per Bit

12.1   Write Per Bit

The write per bit function writes data using the write mask data only in the required DQi pins.   It writes when the write mask data is "1" and prohibits writing when the data is "0".   (Refer to **8.2 Mask Register**).

To use WPB operation

(1)   Execute Special register set command and set WPB data (32 bits) to mask register.

(2)   Execute Bank Activate with WPB enable command (ACTWPB) after t_{RSC} (2 CLK) period from Special register set command (SRS).

(3)   Execute Write/Block write command after t_{RCD} period from ACTWPB.

In case SRS command is executed in activate state to set new WPB data, it is necessary to take t_{RSC} (2 CLK) interval between SRS and Write/Block write command.

Remark   Mask data = Mask register's data (WPB) + DQMi
DQMi is prior to Mask register's data (WPB)

13.   Block Write

13.1   Block Write

This cycle writes the color register data in 256 bits (8 columns x 32 I/Os) memory cell in one cycle.   The memory cell range in which data can be written in one block write cycle is eight continuous columns on one row address.
This cycle controls writing in 8 columns x 8 DQ = 64 bits by DQM0 to DQM3 input.   Color register data is written to the memory cell if DQM is low but not if DQM is high.   DQM0 corresponds to the lowest byte (DQ0 to DQ7), DQM1 corresponds to DQ8 to DQ15, DQM2 corresponds to DQ16 to DQ23, DQM3 corresponds to DQ24 to DQ31.
Any column of the eight columns can be selected and writing prohibited.   Determine whether to write or prohibit writing according to the data selected for column.   (Refer to **13.2 Column Mask**)

To use Block write operation

(1)   Execute Special register set command and set color data (32 bits) to color register.

(2)   Execute Bank Activate (ACT) or Bank Activate with WPB enable command (ACTWPB) after t_{RSC} (2 CLK) period from SRS.

(3)   Execute Block write command after t_{RCD} period from ACT or ACTWPB.

In case new Write/Block write is executed or, it is necessary to take t_{BWC} interval from Block Write command to new Write/Block write command.
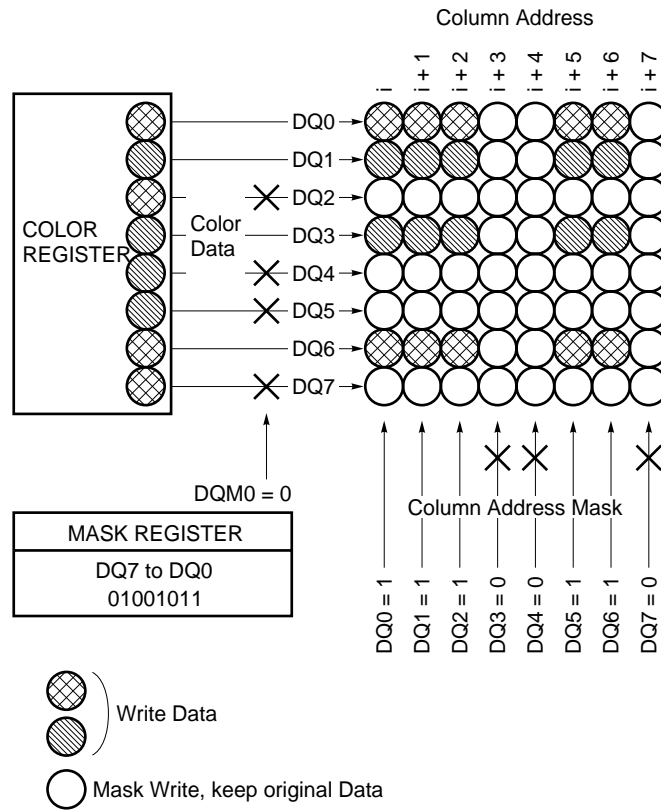

13.2   Column Mask

In block write cycle any column of the eight columns can be selected and writing prohibited.   Determine which column to select according to the DQi pin to which the data selected for the column is to be input.   Refer to the table below.

Column address [Note]	Column address and corresponding DQ pin				Column select data (DQi)	Writing
	A2	A1	A0	DQi		
i (1st column)	0	0	0	DQ0/DQ8/ DQ16/DQ24	1	Yes
					0	No
i+1 (2nd column)	0	0	1	DQ1/DQ9/ DQ17/DQ25	1	Yes
					0	No
i+2 (3rd column)	0	1	0	DQ2/DQ10/ DQ18/DQ26	1	Yes
					0	No
i+3 (4th column)	0	1	1	DQ3/DQ11/ DQ19/DQ27	1	Yes
					0	No
i+4 (5th column)	1	0	0	DQ4/DQ12/ DQ20/DQ28	1	Yes
					0	No
i+5 (6th column)	1	0	1	DQ5/DQ13/ DQ21/DQ29	1	Yes
					0	No
i+6 (7th column)	1	1	0	DQ6/DQ14/ DQ22/DQ30	1	Yes
					0	No
i+7 (8th column)	1	1	1	DQ7/DQ15/ DQ23/DQ31	1	Yes
					0	No

Note   Refer to **13.3 Block Write Function**.

Remark   i is times of 8 numeric.

Remarks 1. i is times of 8 numeric.

2. This diagram shows only for DQ0 - DQ7.   The other DQ is similar as this.

14. Read/Write Command Interval

14.1 Read to Read Command Interval

During READ cycle, when new Read command is asserted, it will be effective after /CAS latency, even if the previous READ operation does not completed.   READ will be interrupted by another READ.

The interval between the commands is minimum 1 cycle.   Each Read command can be asserted in every clock without any restriction.

Burst length = 4, /CAS latency = 2
14.2 Write to Write Command Interval

During WRITE cycle, when new Write command is asserted,   the previous burst will terminate and the new burst will begin with a new Write command.   WRITE will be interrupted by another WRITE.
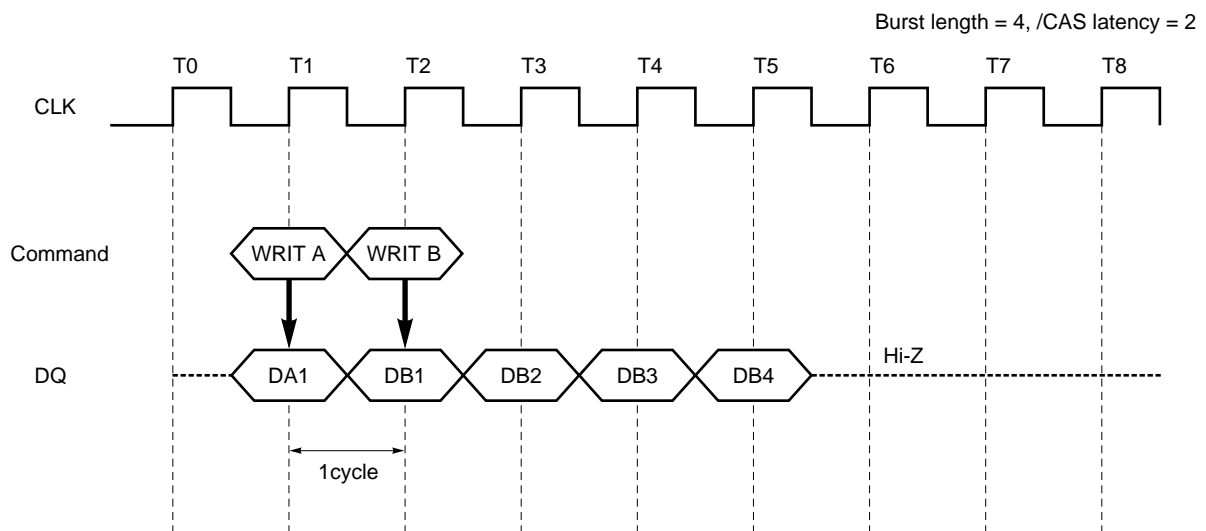

The interval between the commands is minimum 1 cycle.   Each Write command can be asserted in every clock without any restriction.
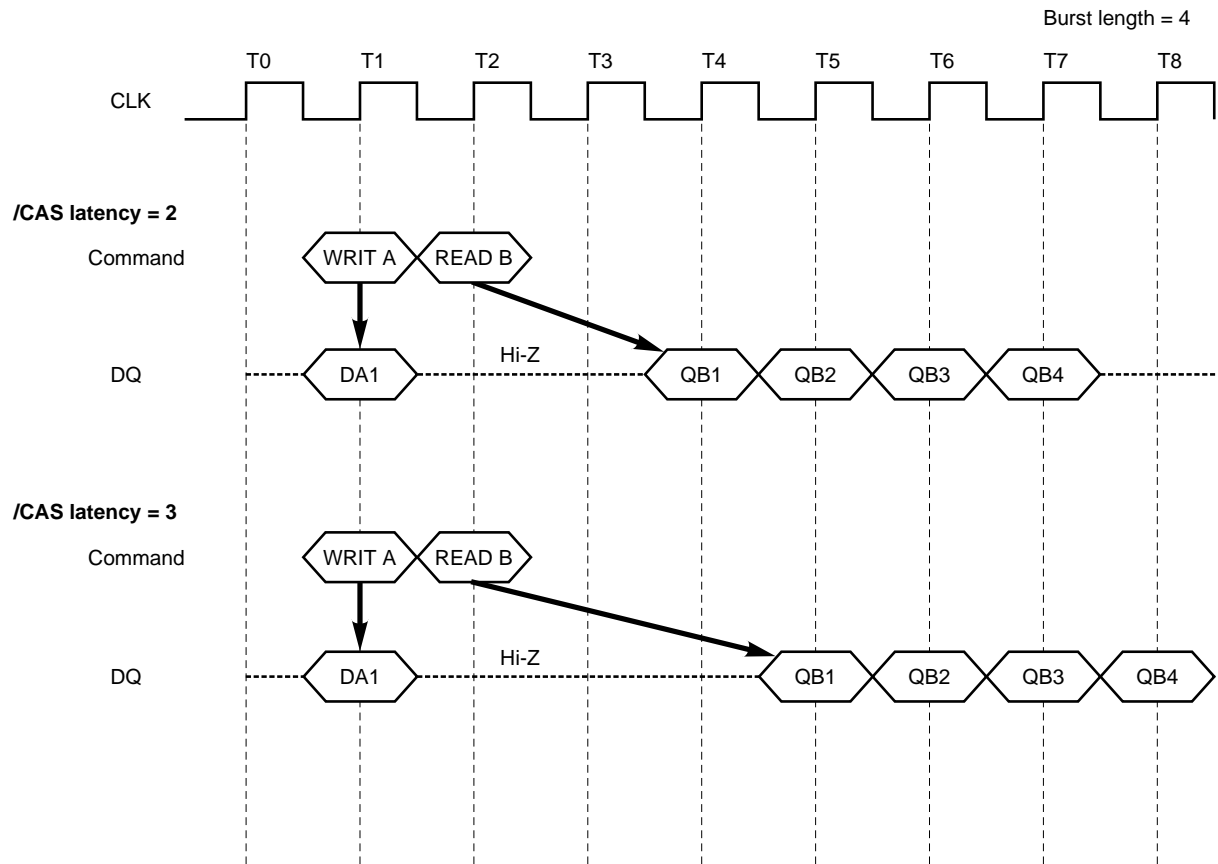

Burst length = 4, /CAS latency = 2

14.3 Write to Read Command Interval

Write command and Read command interval is also 1 cycle.

Only the write data before Read command will be written.

The data bus must be Hi-Z at least one cycle prior to the first D_{OUT}.

Burst length = 4

14.4   Block Write to Write or Write/Block Write Command Interval

The interval between BLOCK WRITE and new BLOCK WRITE or WRITE is t_{BWC} or minimum 1 cycle.   If t_{CK} is less than t_{BWC}, NOP command should be issued for the cycle between BLOCK WRITE and the following WRITE or new BLOCK WRITE.
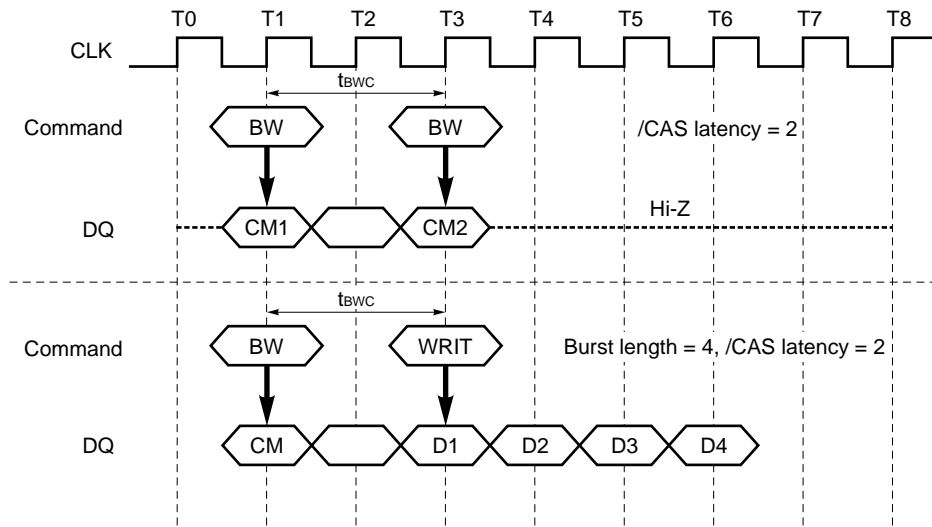

14.5   Block Write to Read Command Interval

BLOCK WRITE command and READ command is also t_{BWC} or minimum 1 cycle.   The data bus must be Hi-Z at least one cycle prior to the first D_{OUT}.
14.6   Read to Write/Block Write Command Interval

During READ cycle, Read can be interrupted by WRITE/BLOCK WRITE.

The READ and WRITE/BLOCK WRITE command interval is mimimum 1 cycle.   There is a restriction to avoid data conflict.   The Data bus must be Hi-Z using DQM before WRITE/BLOCK WRITE.
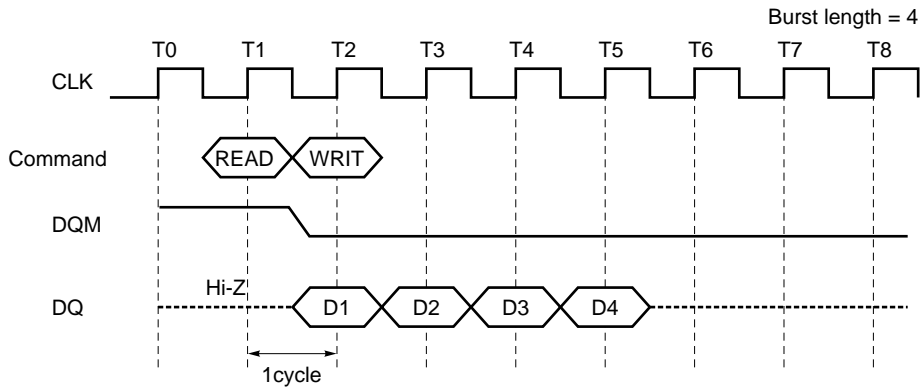

Read can be interrupted by WRITE/BLOCK WRITE.   DQM must be High at least 3 clocks prior to the Write command.

                 Preliminary Data Sheet
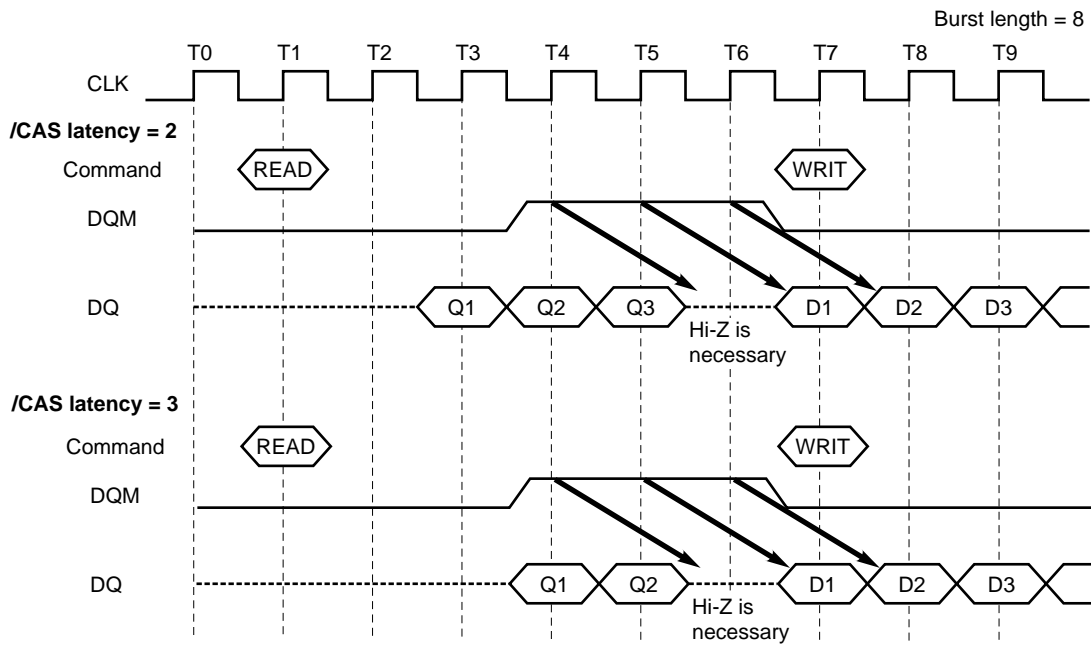

15. Burst Termination

Burst termination is to terminate a burst operation other than using a read or write command.

15.1 Burst Stop Command in Full Page

Burst Stop command is operated only in case full page burst mode. During the other burst mode, Burst Stop command is NOP.

During full page burst read cycle, when the burst stop command is asserted, the burst read data are terminated and the data bus goes to high-impedance after the /CAS latency from the burst stop command.

Burst length = Full page, /CAS latency = 2, 3
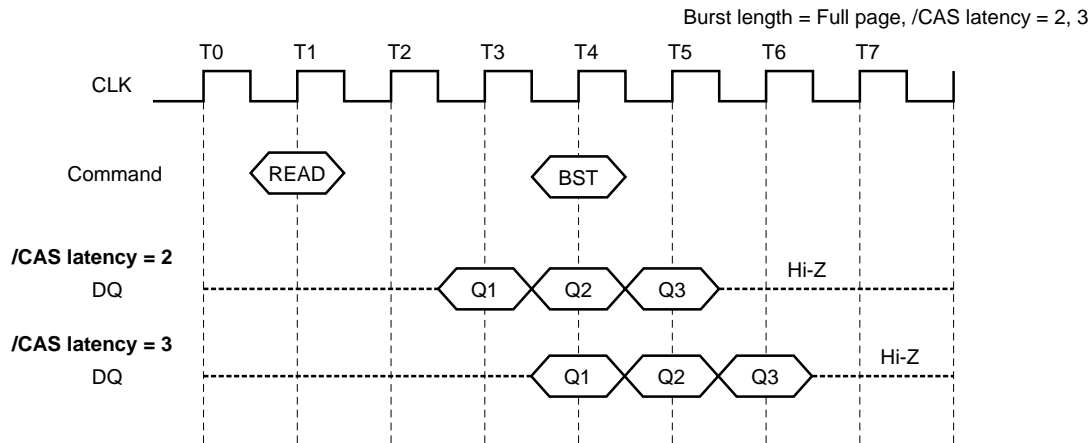

During full page burst write cycle, when the burst stop command is asserted, the burst read data are terminated and data bus goes to high-impedance at the same clock with the burst stop command.

Burst length = Full page, /CAS latency = 2, 3
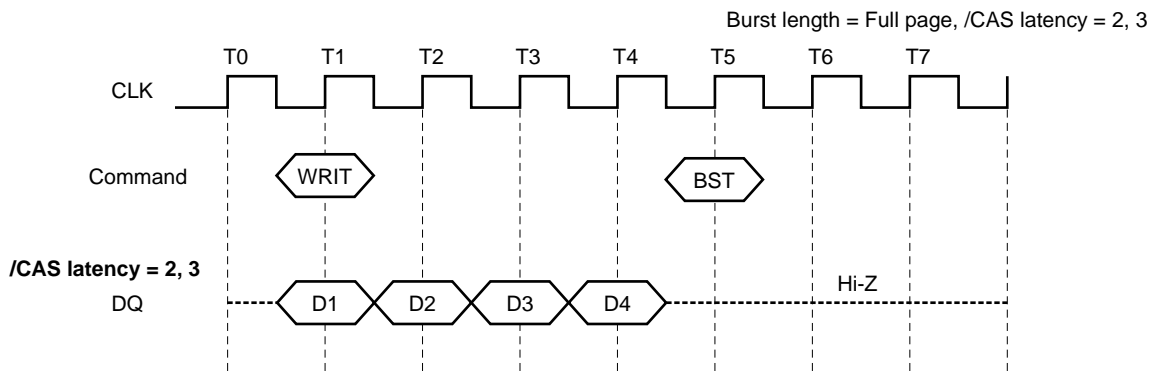

15.2   Precharge Termination

15.2.1   Precharge Termination in READ Cycle

During READ cycle, the burst read operation is terminated by a precharge command.

When the precharge command is asserted, the burst read operation is terminated and precharge starts.

When the precharge command is asserted, t_{RAS} must be satisfied.

The same bank can be activated again after t_{RP} from the precharge command.

When /CAS latency is 2, the read data will remain valid until one clock after the precharge command.

Burst length = X, /CAS latency = 2
When /CAS latency is 3, the read data will remain valid until two clocks after the precharge command.

Burst length = X, /CAS latency = 3
15.2.2 Precharge Termination in WRITE cycle

During WRITE cycle, the burst write operation is terminated by a precharge command.

When the precharge command is asserted, the burst write operation is terminated and precharge starts.

The same bank can be activated again after t_{RP} from the precharge command.

The DQM must be high to mask invalid data in.

When /CAS latency is 2, the write data written prior to the precharge command will be correctly stored.   However, invalid data may be written at the same clock as the precharge command.   To prevent this from happening, DQM must be high at the same clock as the precharge command.   This will mask the invalid data.

Burst length = X, /CAS latency = 2
When /CAS latency is 3, the write data written prior to the precharge command will be correctly stored.

However, invalid data may be written at the same clock as the precharge command. To prevent this from happening, DQM must be high at the same clock as the precharge command.   This will mask the invalid data.

Burst length = X, /CAS latency = 3
16. Electrical Specifications

- All voltages are referenced to Vss (GND).

- After power up, wait more than 100 μs and then, execute **Power on sequence and Auto Refresh** before proper device operation is achieved.

Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Voltage on power supply pin relative to GND	V_{CC}		−1.0 to +4.6	V
Voltage on input pin relative to GND	V_T		−1.0 to +4.6	V
Short circuit output current	I_O		50	mA
Power dissipation	P_D		1	W
Operating ambient temperature	T_A		0 to +70	°C
Storage temperature	T_{stg}		−55 to +125	°C

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply voltage	V_{CC}		3.0	3.3	3.6	V
High level input voltage	V_{IH}		2.0		V_{CC} + 0.3	V
Low level input voltage	V_{IL}		−0.3		+ 0.8	V
Operating ambient temperature	T_A		0		70	°C

Capacitance (T_A = 25 °C, f = 1 MHz)

Parameter	Symbol	Test condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{I1}	A0 - A9	2		4	pF
	C_{I2}	CLK, CKE, /CS, /RAS, /CAS, /WE, DSF, DQM0 - DQM3	2		4	
Data input/output capacitance	$C_{I/O}$	DQ0 - DQ31	2		5	pF

DC Characteristics (Recommended Operating Conditions unless otherwise noted)

Parameter	Symbol	Test condition			MIN.	MAX.	Unit	Notes
Operating current	I_{CC1}	Burst length = 1		-A10		105	mA	1
		$t_{RC} \geq t_{RC(MIN.)}$, $I_O = 0$ mA		-A12		90

	$I_{CC2}PS$	CKE $\leq V_{IL(MAX.)}$, $t_{CK} = \infty$				6		
Precharge standby current in non power down mode	$I_{CC2}N$	CKE $\geq V_{IH(MIN.)}$, $t_{CK} = 15$ ns, /CS $\geq V_{IH(MIN.)}$, Input signals are changed one time during 30 ns.				36	mA	
	$I_{CC2}NS$	CKE $\geq V_{IH(MIN.)}$, $t_{CK} = \infty$ Input signals are stable.				22		
Active standby current in power down mode	$I_{CC3}P$	CKE $\leq V_{IL(MAX.)}$, $t_{CK} = 15$ ns				7	mA	
	$I_{CC3}PS$	CKE $\leq V_{IL(MAX.)}$, $t_{CK} = \infty$				6		
Active standby current in non power down mode	$I_{CC3}N$	CKE $\geq V_{IH(MIN.)}$, $t_{CK} = 15$ ns, /CS $\geq V_{IH(MIN.)}$, Input signals are changed one time during 30 ns.				36	mA	
	$I_{CC3}NS$	CKE $\geq V_{IH(MIN.)}$, $t_{CK} = \infty$ Input signals are stable.				22		
Operating current (Burst mode)	I_{CC4}	$t_{CK} \geq t_{CK(MIN.)}$ $I_O = 0$ mA	/CAS latency = 2	-A10		155	mA	2
				-A12		130		
			/CAS latency = 3	-A10		200		
				-A12		170		
Refresh current	I_{CC5}	$t_{RC} \geq t_{RC(MIN.)}$		-A10		85	mA	3
				-A12		80		
Self refresh current	I_{CC6}	CKE ≤ 0.2 V				6	mA	
Operating current (Block Write Mode)	I_{CC7}	$t_{CK} \geq t_{CK(MIN.)}$, $I_O = 0$ mA, /CAS cycle = 20 ns				250	mA	
Input leakage current	$I_{I(L)}$	$V_I = 0$ to 3.6 V, All other pins not under test = 0 V			−5.0	+5.0	μA	
Output leakage current	$I_{O(L)}$	D_{OUT} is disabled, $V_O = 0$ to 3.6 V			−5.0	+5.0	μA	
High level output voltage	V_{OH}	$I_O = -2.0$ mA			2.4		V	
Low level output voltage	V_{OL}	$I_O = +2.0$ mA				0.4	V	

Notes 1. I_{CC1} depends on output loading and cycle rates. Specified values are obtained with the output open. In addition to this, I_{CC1} is measured on condition that addresses are changed only one time during $t_{CK(MIN.)}$.

    2. I_{CC4} depends on output loading and cycle rates. Specified values are obtained with the output open. In addition to this, I_{CC4} is measured on condition that addresses are changed only one time during $t_{CK(MIN.)}$.

    3. I_{CC5} is measured on condition that addresses are changed only one time during $t_{CK(MIN.)}$.

AC Characteristics (Recommended Operating Conditions unless otherwise noted)

AC Characteristics Test Conditions

- AC measurements assume $t_T = 1$ ns.
- Reference level for measuring timing of input signals is 1.4 V. Transition times are measured between V_{IH} and V_{IL}.
- If t_T is longer than 1 ns, reference level for measuring timing of input signals is $V_{IH(MIN.)}$ and $V_{IL(MAX.)}$.
- An access time is measured at 1.4 V.

18. Recommended Soldering Conditions

Please consult with our sales offices for soldering conditions of the μPD481850.

Type of Surface Mount Device

μPD481850GF-JBT : 100-pin Plastic QFP (14 x 20 mm)

┌─ **NOTES FOR CMOS DEVICES** ─┐

① **PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② **HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V$_{DD}$ or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ **STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

[MEMO]
