1 Introduction

1.1 General

The PSØ9-EVA-KIT evaluation system provides a complete weighing system made of a main board with LCD panel, two plug-in modules, a 10kg load cell platform and Windows-based evaluation and assembler software. Optionally, the TTL-232R-3V3 cable, a USB TTL serial cable from FTDI is provided if the UART in the PSØ9 is to be tested. The EVA-Kit offers extensive and user-friendly configuration and evaluation of the PSØ9 single-chip solution for weigh scales.

1.2 System Overview PSØ9-EVAL-MB Main Board

- LCD display 22 x 51mm²
- Interface to external LCD controller, Holtek HT1620
- Power select by 2 jumpers:
 - Battery holder for CR2032
 - Wall power supply, Voltage selectable by on-board jumpers
- 9 Push buttons (resistive keys)
- 4 Capacitive (touch) keys
- A SPDT switch to select either SPI or IIC serial interface between the PSØ9 and the PICOPROG programmer
- UART interface

PSØ9-EVAL HR-Module

- For up to 100,000 stable scale divisions & solar applications
- Up to 4 half bridges / Full bridge / Wheatstone bridge
- 4 layer PCB

PSØ9-EVAL LC-Module

- For up to 30,000 stable scale divisions and low cost applications
- Up to 4 half bridges / full bridge / Wheatstone bridge
- 2 layer PCB

PICOPROG V2.0 Programmer

• (USB to SPI/IIC interface)

10kg Load Cell

- 350 Ohm sensor
- Mounted on platform
- Wired as 2 half bridges with 1 span compensation resistor

Optional FTDI TTL-232R-3V3 cable (available upon request). This cable can be provided to test the UART of the PSØ9 by establishing communication between the UART of PSØ9 and a serial terminal application on a Windows PC.

1.3 Component List

- PSØ9-EVA-MB
 Motherboard
- PSØ9-EVA-Module-HR
 Plug-in module- High resolution
- PSØ9-EVA-Module-LC
 Plug-in module- Low cost
- PICOPROG V2.0 Programmer
- Demo scale
 10kg load cell with platform
- High density DSUB15 cable
 Connecting the Evaluation board to the programmer
- USB cable
 Connecting PICOPROG to the PC
- Wall power supply
- CD-ROM Incl. software and data sheets
- Optional FTDI TTL-232R-3V3 cable (upon request)

PSØ9-FVA

2 Connecting Strain Gauges

The evaluation system comes with the load cell already connected to the plug-in module.

In the following we will explain how a user can apply his own load cell. In case of sensors with other than 350 Ohm resistance the discharge capacitor Cload has to be adapted.

The 2 different plug-in modules are designed to support various applications of PSØ9. For high resolution and solar applications, for up to 100,000 stable scale divisions, the external bipolar comparator circuit is used. For applications with lower current consumption and low resolution requirement, the LC variant is used, running which the internal comparator. The LC module has a minimum of components and is the 'low-cost' variant therefore; however resolution will be clearly less than with the HR module.

2.1 HR - High Resolution Module

The HR module is targeted for high resolution and solar applications, for up to 100,000 stable scale divisions. The external bipolar comparator circuit is used in this module.

It is possible to measure up to 4 half bridges. Due to the PICOSTRAIN measurement principle the system does not need a full bridge. Two resistors, in the following called half bridge, are sufficient.

Figure 2-1: High Resolution Module

2.2 LC - Low Cost module

This is a low-cost version of the High resolution module, with minimum necessary components for operation. The following are the distinct features that differentiate the LC module from the HR module:

1. No external comparator. This makes the LC module suitable for applications with high, but not the highest resolution. The internal comparator is used. This reduces the base resolution by 0.8 bit compared to the external comparator.

2. The 4 MHz ceramic crystal oscillator is not present and there is no possibility to connect an external RC oscillator to PSØ9. Thus the PSØ9 can be operated only with the built in RC-oscillator. Operating the PSØ9 with the

internal RC oscillator is known to limit the resolution to approximately 16 bits. An advantage is the lower current consumption, which is around 1.2 mA current at 3V for maximum performance. To configure the internal oscillator for operation please refer to section 4.1 of PSØ9 data sheet.

Figure 2-2: Low-cost Module

2.3 Connecting the Modules (HR and LC)2.3.1 Capacitor Selection and Assembly

The PICOSTRAIN measurement principle is based on measuring the discharge time of a capacitor. For this reason the correct size and material of the capacitors is significant to achieve best measuring results. In general we recommend a discharging time in the range of

$$\tau = 0.7 * R * C = 80$$
 to 120 µs.

As material we recommend COG or CFCAP (Multilayer ceramic from Taiyo-Yuden). X7R capacitors can be used, too, but will show some minor loss in temperature stability.

The recommend values are:

Rsg = 350 Ohm \rightarrow Cload = 300 nF to 400 nF

Rsg = 1000 Ohm \rightarrow Cload = 100 nF to 150 nF

The plug-in module is pre-assembled with Cload = $4 \times 100 \text{ nF} = 400 \text{ nF}$.

2.3.2 Half bridge

A half bridge is sufficient to run the PSØ9 evaluation system. The following picture shows how to connect the half bridge the conventional way. It is basically connected to the pads A and B (SG_A1 and SG_A2, SG_B1 and SG_B2 are shorted). For the gain and temperature measurement, external resistors Rext1 and Rext2 are connected the pads C and D (also shorted).

FICOSTRAIN

Figure 2-3a: Half Bridge, Classical

An alternative way of connecting a half bridge to PSØ9 is shown below, where the unused ports C and D are connected parallel to Ports A and B respectively. The external resistors are avoided in this connection. The option for using an external comparator is available only on the HR-module.

Figure 2-3b: Half Bridge, Alternative

Please note: Both wiring options shown in figure 3a and 3b have to be done externally, i.e. at the solder pad of the module. There are no wiring or placement options on the module itself.

2.3.3 Half bridge connection for Solar Applications

In solar applications the reduction of the current consumption has the highest priority. The unique capability of PICOSTRAIN allows us to modify a full bridge load cell in such a way that it becomes a half bridge with twice the resistance. So with 1 kOhm strain gauges the load cell shows a total resistance of 2 kOhm. The current into the sensor is reduced by a factor of 2. This option is reasonable in case all the strain gauges are on one side of the load cell.

Figure 2-4: Half Bridge, Solar

2.3.4 Full bridge

For PICOSTRAIN a full bridge is ideally separated into two half bridges. This wiring can increase the resolution compared to Wheatstone bridges by 0.6 bit.

Figure 2-5: Full Bridge

PSØ9-EVA

Existing sensors with Wheatstone bridge connection might be adapted just by changing the wiring according to the following picture.

Figure 2-6: Adapted Load Cell Wiring

For certain advantages like resolution, PSRR etc. depending on the application, it might be necessary to use the PSØ81 compatible mode of PSØ9. For details on this mode and its associated advantages, please refer to section 3.3.5 of PSØ9 data sheet.

2.3.5 Wheatstone Full Bridge

Existing load cells in Wheatstone configuration can be connected to the module without any modification as long as they have only one or no compensation resistor. In case the bridge has two compensation resistors one of those needs to be shortened.

In general Wheastone wiring will end in 0.6 bit less resolution compared to PICOSTRAIN wiring. It might be reasonable to use Wheatstone bridges in case of cables to the sensor longer than 0.5 m. The following figure shows the connection of the Wheatstone bridge.

The PICOSTRAIN measurement principle is based on measuring the discharge time of a capacitor. For this reason the correct size and material of the capacitors is significant to achieve best measuring results. For Wheatstone, the discharging time is furthermore reduced by the factor of 0.7, The following formula can be used to calculate the discharging capacitance.

$$\tau = 0.7 * 0.75 * R * C = 60$$
 to 110 µs.

As material we recommend COG or CFCAP (Multilayer ceramic from Taiyo-Yuden), X7R capacitors can be used, too, but will show some minor loss in temperature stability.

The recommend values for Wheatstone mode are:

Rsg = 350 Ohm	→Cload = 300 nF to 400 nF

Rsg = 1000 Ohm →Cload = 100 nF to 200 nF

Please note: In Wheatstone mode the operation via SPI interface is recommended. If IIC is to be used, please operate in Single Conversion Mode. See also the bug report in the PSO9 data sheet.

2.3.6 Quattro mode

In quattro mode the PSØ9 measures 4 half bridges. The 4 half bridges are measured independently and the gain of each half bridge can be corrected separately. Typical applications are bathroom-scales, baby or platform scales.

3 Motherboard

The motherboard connects to the PICOPROG programmer. It serves the various power options. It holds the LCD panel. The 9 push buttons (resistive keys) and 4 capacitive keys can be used in stand-alone operation.

The jumpers for power select can also be used to measure the current consumption of the system.

3.1 LCD

The LCD has the following specification:

Duty $\frac{1}{4}$, Bias 1/3, Operating voltage 2.5V, Operating temperature 0°C to 50°C.

Figure 3-1: Motherboard

3.2 External LCD driver

PSØ9 offers the possibility to support an external LCD driver. Therefore a simplified SPI master mode is programmed in the PSØ9, especially adapted to Holtek HT1620 LCD driver. Three GPIOs of the PSØ9 are used to realize the SPI master interface to connect to the Holtek driver. The PSØ9 can generate a configurable 32 kHz clock needed to drive the HT1620 driver, thus avoiding the necessity of an external crystal oscillator for the LCD Driver. One GPIO is additionally used to for this clock.

The LCD driver on the PSØ9 Motherboard can be powered by the output of a voltage regulator (fixed voltage of 3V). Optionally the LCD driver can be powered by the voltage selected by the on-board jumpers on the motherboard (voltage adjustable). The appropriate jumper (J26 (fixed) or J27 (adjustable)) has to be soldered in order to select the source of the LCD's power supply.

Figure 3-2: External LCD Driver

The following picture shows the connection of an external LCD driver circuit:

Figure 3-3: External LCD Driver Wiring

A flowchart showing the general sequence to program the PSØ9 in order to operate the external LCD driver is illustrated in Section 4.8 of the PSØ9 Data sheet. The flowchart is however based on the idea that GPIOs 5, 6, 7 would be used as the SPI communication lines. The PSØ9 EVA board supports communication to the Holtek driver only via GPIOs 0, 1, 2. Sample programs which use the LCD for display, along with the appropriate header files that are specific to the Holtek driver, HT1620 are available as part of the PSØ9 Assembler examples.

4 Load cell

The evaluation system is shipped with a ready made demonstration scale connected to the high resolution module.

The load cell is model CZL601SE-10kg from Hua Lan Hai (http://www.chinesesensor.com/Single-point_Load_Cell. html).

4.1 Technical Specification

5 Evaluation Software

5.1 Installing the PSØ9-EVA Software

The PSØ9-EVA software runs under the following operating systems

- Windows 2000
- Windows XP
- Windows Vista (please use the software/drivers for Windows 7)
- Windows 7

Please follow the described procedure to install the software and driver:

NOTE: Ensure that the Picoprog V2.0 programmer is disconnected before starting the procedure.

- 1. Install the device drivers by running setup.exe from Driver/PicoProg v2 Driver Installer Stand-Alone. Select the shown default paths and continue the setup procedure.
- 2. At the end of step 1, you will be asked in a separate window (batch-file) to connect the Picoprog V2.0 programmer. Please insert the PicoProg to your computer.
- The driver is installed; a windows message may pop up asking you to install the driver though it is not signed. Please install it anyway.
- 4. The batch file asks you to plug in the programmer and it is now enumerated. Unplug and insert the Picoprog programmer.
- 5. Install the PSØ9 Assembler software from Software PSØ9-Assembler-Software XP-WIN7 Volume2-O-xx setup.exe from the CD.
- 6. If required perform a system restart.
- 7. The assembler software is now ready to use. Open the PSØ9 Assembler software, the respective firmware is downloaded into the programmer automatically and the LED on the Picoprog programmer is illuminated.
- 8. You can test to find the programmer on the 'Download' page and press 'Get Device Info'.
- 9. Install the evaluation software now from Software\PSØ9-Evaluation-Software\Setup.exe
- 10. Once the software is installed, launch the application from the start menu. The software opens and a pop up window asks to select a firmware for Picoprog.
- 11. Select the hex-file (firmware) for Picoprog in the folder "data" The hex-file itself is named PSØ9_FWxx.hex
- 12. If everything is correctly installed, the USB identifier must be USB:: 0x194E:: 0x100F::NI-VISA.
- 13. Please confirm connection by clicking the button 'Verify Interface'. 'OK' should be shown in the pop-up window.

Optionally you can see a video-tutorial about the PSO8 Assembler Software (which structurally the same as the PSØ9 Assembler) by watching the video from:

→ ASM-Screencast.exe in PSO8-Assembler-Introduction \ Flash folder.

5.2 Running the Evaluation Software

The software comes up with the following window:

5.2.1 Setup Page

Figure 5-7: Expert Page

This page refers to expert setting only. Please change settings only after getting an introduction by an acam engi-

neer.

5.2.7 Memory Page

Figure 5-8: Memory Page

RAM: Shows the contents of the RAM address selected

The RAM can be written and read directly from this page.

Internal EEPROM:	Shows the content of the internal EEPROM at the selected address. Individual addresses
	can be erased, written and read. The entire EEPROM can be erased and written in one go
	also.
OTP:	Shows the content of the OTP at the selected address. There are buttons to switch on the
	OTP, enable the VPP to the OTP and the PROG line to the OTP, too; these are required to
	write to the OTP from the evaluation software.
	Caution: naturally the OTP can only be written once (or incrementally several times).
	That means, correction or re-writing of cells is not possible!
External EEPROM:	Shows the content of the external EEPROM used during program development. All the
	addresses can be read and written. It is possible to erase a selected number of bytes.
Start New Cycle:	Start manually a new measurement.
Send byte to PSØ9:	Sends the byte to the PSØ9 through SPI/IIC interface
Send SSN only:	Toggles the CSN of the SPI interface to the PSØ9.

		pac	Jour			(Enables/Disables o	lig. input buffer) (Sets	output I/Os to O o 1)	

Button test:	Allows configuring the multi-input keys. There are only 8 out of possible 24 multi-input
	keys realized in hardware on the motherboard. When the keys are configured and
	when the buttons on the motherboard are pressed, the keys displayed in the software
	light up (like an LED).
Capacitive keys:	Allows configuring the 4 capacitive ports. Display shows the status of the 4 capacitive
	ports. When the capacitive keys are configured correctly, then the display in the soft-
	ware changes accordingly when the keys on the motherboard are touched or operated.
UART:	Allows enabling and configuring the UART.
Configure I/O ports:	Allows configuring each of the 8 GPIOs as input or output with various options. When
	output, allows to set the value on the output pin. When input, the digital input buffers
	ought to be enabled here. Additionally the multi- functional diagnostic pins (MULTIO3 $\&$
	4) can also be configured here. These configurations must also be done respectively
	when using the multi-input or capacitive keys or the UART.

5.2.9 Temperature Compensation Page

Figure 5-10: Temperature Compensation Page

This page contains all the settings that are used for temperature compensation of a load cell system connected to

the PSO9. Either full compensation can be performed or only Offset compensation can also be done.

Pre-selected values for Temp. Comp: Arbitrary pre-selected values of TkGain and TkOffset before beginning the compensation procedure are set in this part of the page. Reference values: The parameters pertaining to the temperature coefficient of the internal Rspan are set here. Lower temperature / higher tempera-The measurement values taken at lower temperature and higher temperature with load and with NO load are all displayed here. The ture: measurements are performed automatically after pressing 'Start Measurement'. After the compensation process, the newly calculated values of TkGain and TkOffset are shown at the bottom of the page. Select DLC config. Configurations for doing the adjustment procedure according to OIML 3000 or OIML 6000. The configuration should be selected before starting with the compensation procedure.

Store TkGain and TkOffset in EEPROM:

The values of the TkGain and TkOffset after the temperature compensation can be stored in data EEPROM at user selectable addresses.

The process of the temperature compensation with the evaluation software is practically shown in a dedicated screencast (a screencast is a basically an instruction video). It contains the theory behind the PICOSTRIAN temperature compensation as well as its practical application in the software. To download the screencast please go to: http://www.acam.de/download-center/picostrain

6	Assembler Software	6-2
6.1	Installing the Assembler Software	6-2
6.2	Running the Assembler	6-2
6.2.4	1 Assembler Online Help	6-2
6.2.2	2 Assembler Tab Page	6-3
6.2.3	3 Debugger Page	6-6
6.2.4	4 Download Page	6-8
6.2.5	5 Assembler Settings	6-10

6 Assembler Software

Features:

Platform:	Windows 2000, XP, Vista (32-Bit), Windows-7 (32 and 64)
Type of Assembler:	Single Path Assembler
Source-File:	*.asm, according to the PSØ9 assembler syntax
Target-File:	Output. hex, downloadable Hex-File
Instruction:	<command/> [<parameter1>, <parameter2>, <parameter3>]</parameter3></parameter2></parameter1>
	For example:
	nop or incrz or add x,y or gotoBitC x, 5, case1
Comment(s):	Single line comment: ;
	Multi line comment: <comment> <endcomment></endcomment></comment>
Includes:	Including files is possible with:
	#include "myfile.h"
	No limit to the number of include files
Constants:	Constants can be defined with:
	CONST myConst8 15
	The constants have to be declared before they are used for the first time.
Number formatting:	Numbers can be written in decimal or hexadecimal notation
	e.g.: add x,20 or add x, 0x14
Jump labels:	To jump within the code, you can use jump labels together with goto.
	E.g.: goto case1
	case1: move x,y
Addressing:	Addressing is automatically done by the assembler. Please note, that you must
	provide at least 48 bytes of configuration data, maximum are 8k bytes of user
	programmable space.
Subroutines:	Subroutines can be executed with the special opcode ,jsub' and ,jsubret'.

6.1 Installing the Assembler Software

Insert the CD-ROM. Run Software\PSØ9-Assembler-Software\Volume2-O-xx\setup.exe to install the program. Restart the computer if required. After the installation you will find in the START menu an item "PSØ9 Assembler". Run this to start the assembler program.

6.2 Running the Assembler

In the START menu there is an item "PSØ9 Assembler". Run this to start the assembler program.

6.2.1 Assembler Online Help

The following sections give just a short description of the assembler program. For a detailed description of the assembler software please use the online help of the program. The online help can be opened from the Menu or by pressing the F1 button.

The following help window opens up:

6.2.2 Assembler Tab Page

PSØ9-EVA

The 'Assembler' tab page is the main window to open all the source code and include files. It consists of a status message window at the bottom and buttons to operate the assembler. By clicking the green link labeled ,Opcode-Help (F2)'an integrated online help pops up which provides detailed information about the available op codes.

The controls in detail:

Source code window:	This window is used as the source code and include files editor for the assembler
	listings (*.asm & *.h files). This is a pure editor window; any number of tabs can be
	opened in this window. This page allows the user to display and edit any file. The files
	can be manually opened, saved and closed. The location of the file displayed in the
	window currently is displayed next to the 'Compile' button.
	Additional features are line numbering, syntax highlighting and integrated comment
	handling. Standard editor tasks like cut, copy & paste or find & replace, etc. can be
	performed. You can modify the settings for the editor via the tool settings dialog. To
	know more about 'Include' files and how to use them, see Section 6.2.2.1 below.
Assembler button:	The assembler button to compile the source code along with the respective header
	files is: Compile. On pressing the Compile button the source file is compiled to a down-
	loadable hex code. If the assembly run was successful a message is displayed accor-
	dingly. If the compiling fails, an error message occurs.
	If more than one source files are currently open, then the *.asm that will be compiled
	on pressing the Compile Button, has the filename in bold letters on the tab. It is the
	firstly opened .asm file in the window that is always compiled.
Save Project button:	When a source code (*.asm) file and all the respective include (*.h) files are open in
Save Project button:	When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj),
Save Project button:	When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj), by pressing the Save Project button. The .prj file always takes the name of the *.asm
Save Project button:	When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj), by pressing the Save Project button. The .prj file always takes the name of the *.asm file.
Save Project button:	When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj), by pressing the Save Project button. The .prj file always takes the name of the *.asm file. For e.g. A source code file sample.asm uses 'include' files include1.h and include2.h.
Save Project button:	 When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj), by pressing the Save Project button. The .prj file always takes the name of the *.asm file. For e.g. A source code file sample.asm uses 'include' files include1.h and include2.h. Then the corresponding prj file would be saved by the name sample.prj. Once saved,
Save Project button:	 When a source code (*.asm) file and all the respective include (*.h) files are open in the Assembler tab, then all the files can be combined and saved in a project file (*.prj), by pressing the Save Project button. The .prj file always takes the name of the *.asm file. For e.g. A source code file sample.asm uses 'include' files include1.h and include2.h. Then the corresponding prj file would be saved by the name sample.prj. Once saved, the *.prj file can be opened from the menu File -> Open project. This automatically

For e.g. A source code file sample.asm uses 'include' files include1.h and include2.h. Then the corresponding prj file would be saved by the name sample.prj. Once saved, the *.prj file can be opened from the menu File -> Open project. This automatically closes all currently open files and opens all the files (*.asm and *.h) belonging to the project in one go. The *.prj file can also be opened and edited in this Window. Note1: The .asm and .h files can be in different folders or locations. The *.prj file

	Note2: When the PSO9 Assembler software is closed, a .prj project file is automati-
	cally generated with all the files that are currently open in the window. The name of
	this project file will be that of the main source code file open with a .prj extension. This
	.prj file will be used to open all these files again when the PSO9 Assembler software is
	started again.
Open Project button:	An already saved project (with a *.prj file), can be opened using this button.
Status message window:	In this window there are the output messages of the assembler displayed. In case the
	assembly process was successful, a corresponding message appears with the path
	of the file that was compiled. If an error occurs while assembling, an error message
	appears together with the line number and the file name in which the error occurred.
	An error in any of the source code (*.asm) file or "include" (*.h) files is identified and
	intimated with the path.
Opcode-Help:	Between the source code window and the status message window there can be found
	a green link labeled ,Op code-Help (F2)'. By clicking this link another window pops up.
	The window contains the op code online help. Every available op code is explained the-
	re in detail. The additional windows are based on the integrated Microsoft Windows ®
	Help system and can be operated separately. (Windows is a trademark of Microsoft
	Corporation)

Running the assembler in order to compile your source file is the first step when using the PSØ9 Assembler Software. Further steps like downloading the hex file or using the debugger are based on a successful assembler run. In case any errors occur please correct your source code and run the assembler again.

An integrated 'examples' folder provides some examples related to the assembler structure itself as well as specific applications like displaying something on the LCD on key press, configuration of multi input keys, capacitive keys or simple weigh scale programs. The user can also add his own examples to the 'Examples' folder with the respective prj file. The prj file can be written manually (See format of existing prj files in the Examples folder) or can be allowed to be generated by the assembler with the Save Project button. The Search-Examples dialog box can be accessed via the Help menu or by pressing F4 or by clicking on the 'Bulb' icon on the top. Only *.prj project files can be opened via the Search Examples option. To open individual files, use the File -> Open option.

PSØ9-EVA

6.2.2.1 'Include' files:

The basic idea of supporting 'include' files is to provide more modularity and flexibility within your coding. That means, instead of packing all needed source code to a single assembler listing (*.asm files) you can roll out some pieces of code to the include files (also called header files with extension *.h). The advantage of this method is, that the readability of your code will be improved and that once written parts of code can be reused (e.g. configuration information).

To include parts of code by using a include file there are two steps needed.

Step 1: Create an include file (e.g. config.h).

Step 2: Declare the inclusion in your assembler listing as follows: #include "config.h"

Include files that are in the same folder as the source file (*.asm) can be included with "filename.h". Include files that are in a path one level higher than the source file can be included with "../filename.h". If there is a set of common include files, they can be segregated in a folder called Lib in PSO9 Assembler/Lib. The Include files in the Lib folder can be included in the program by <filename.h>. They are automatically included from the Lib folder. The alternative method of using a single assembler files without using 'include' files at all is also supported.

This tab provides a powerful debug interface. On this page you can debug the programs you wrote and make the processing of the code transparent. There are many data additionally available, e.g. status of the flags, content of the accumulator registers x,y,z or the content of the RAM. It is also possible to emulate the reset button. An active debugging process is indicated by a LED. There are several debug-modes available.

Please run the assembler on your listing first and make sure the file is processed successfully. Download the hex file then and switch then to the debugger tab. You should be able to debug the file now.

Source Code Window:	The source code and all the include files are shown in this window again (read-only) in
	multiple tabs. It is possible to set breakpoints on the left column of the window (next
	to the line numbering) in any of the files. During the debug process the line which is
	currently processed will be highlighted.
	Note: the break-point symbol will be shown on WIN 7 systems. On Win-XP systems
	there is only the line highlighted in red, but no stop symbol
Hex code Window:	The corresponding hex code is displayed in this window. During the debug process the
	line of the last received op code will be highlighted yellow.
Debug Buttons:	There are six buttons available to control the debug process:
	Debug Buttons: There are six buttons available to control the debug process:
	- Run To Breakpoint: set a breakpoint on the left column by double-clicking in it. Pres-
	sing the button let the debugger run until the breakpoint is reached.
	- Run To Cursor: place the cursor in any line in the Source Code Window and press
	the button. The program will be processed until the line where the cursor is placed
	currently.
	- Single Step: press this button and one single instruction will be performed at a time.
	This mode is well suited for watching the step to step processing, e.g. the jump to a
	subroutine.
	- New Debug Cycle: by pressing this button the debug mode is exited and entered
	explicitly. That means also, that all settings are cleared.
	- Exit Debug Mode: by pressing this button the debug mode is exited
	- LED indicator: the LED indicates the current status of the debugger. If it is grayed
	the debugger isn't active. An active debugger is indicated through an orange-colored
	LED labeled with ,RUNNING ['] on it.

The controls in detail:

FICOSTRAIN

Debugging information:	Debugging information: In this area of the tab there is additional information shown
	corresponding to the last processed instruction. For example, the corresponding
	address is shown, the state of the flags and the content of the accumulator registers
	x,y,z.
Reset button:	The reset button performs a reset of the PSØ9.
RAM information:	In this area RAM information is shown. While the last $\&$ current RAM address and
	their contents are shown every time, you can press the button ,Show RAM content'
	and you will get another pop-up window where you find the RAM content of addresses
	0255. It shows the content of the entire RAM address space, the addresses being
	sorted into one of 4 colors. The color indicates if the RAM address is a 'Reserved
	address', 'User RAM address', 'System RAM address' or 'Configuration RAM address'.
	When the program is being debugged, the RAM contents displayed can be refreshed
	with the 'Refresh' button on the pop-up window.

The debugger tab page gives you the possibility to run your program step by step or only parts of it and a lot more. Additional information is obtained which is normally not obvious.

6.2.4 Download Page

The 'Download' tab provides an interface to program the PSØ9 with the compiled hex code. For this purpose the hexfile is displayed and several buttons are provided to handle the download. A big message window shows the status of the connection and the programming. Furthermore a LED indicates success or failure of the download.

The controls in detail:

Hex code Window:	The previously compiled hex-file is displayed in this window. Furthermore the path to
	the file is displayed above the window in order to have the possibility to check if it is the
	proper file.
Download Buttons:	There are five buttons available to handle the download process:
	- Get Device Info: press this button to receive general information about the USB con-
	nection and the device itself (e.g. instrument handle, vendor-id, etc.). In case there are
	problems with the USB connection this button and the corresponding messages can
	help to find the problem's cause.
	- Download Hex-File: by pressing this button the current displayed hex-file is downloaded
	to the PSØ9. Whether the code has to be downloaded to the external SPI EEPROM or
	the on chip OTP can be selected with the drop down menu. The several steps which
	are performed, like erasing blocks or writing the data, can be monitored in the Status
	Messages Window.
	- To: Selects the download destination. Whether the code has to be downloaded to the
	external SPI EEPROM or the on chip OTP must be selected with this menu.
	Read & Verify: press this button to verify the OTP/EEPROM content matches the
	selected hex code file content. Caution: naturally the OTP can only be written once (or
	incrementally several times). That means that correction or re-writing of cells is not
	possible!
	- Select Hex-File: in the case you don't want to download the currently displayed hex-file
	(or none hex-file is selected yet) you can choose a previously compiled hex-file via this
	button. By pressing this button a file select popup window appears where you can se-
	lect your file. The file is displayed then in the hex code window and can be downloaded
	by pressing the ,Download Hex-File' button then.
	- Reset Interface: in case there are any problems or disturbances with the USB con-
	nection, the interface can be reset via this button.
	Read Protect: This check box is enabled only when the download destination is the
	OTP. When selected, the fuse address 8143 of the OTP is additionally written with a
	non-zero value automatically, thus read protecting the OTP. Hence this must be set
	very carefully only in the last step of programming completion. For more information
	refer Section 6.2 .1 of PSØ9 data sheet.

Status Messages Win-	In this window there are the status messages displayed regarding the download pro-
dow:	Cess.
Status Indicator:	The status indicator LED shows the success of the performed action. While an action
	is performed the LED color is orange and labeled with ,IN PROGRESS'. After finishing
	the action the LED shows either ,SUCCESS' on a green background in case the action
	was performed successfully or ,FAILED' on a red background in case the last action
	failed.

Please note, that downloading the hex code to the OTP/ external EEPROM is a required step to perform before you can use the debugger.

6.2.5 Assembler Settings

Different settings for the assembler and the editor can be done by selecting the item "Settings" in the "Tools" menu. A screen appears that shows the following sheets:

<u>Mindow settings</u>		
 Allow Window Maximization] 		
Show hints		
Show tooltips		
Languages:	Download:	2 wire address
Automatic codepage detection at startup	Use IIC protocol	0
Debuqqer		
Suppress message about invalid holding poin	t	
Suppress refreshing of debug information with	n every single step	
Enlarge debug timeout to max		
Suppress proper file detection		
Suppress EOF pop-up		

tings		
Environment Editor		
Editor settings:		
Show line numbering		
Line numbering in gray		
Apply syntax highlighting		
F Enable Multibyte Support		
These defends and the second		
Clear ALL settings (requires application restart)	Apply	Cancel

Note: If the communication with the PSØ9 is to take place through SPI protocol or IIC protocol must be set accordingly in the Settings tab [] 'Use IIC protocol' option and also on the PSØ9-EVAL Motherboard using the on-board jumper.
