V-MUX® is a Vehicle Multiplex System that offers tremendous flexibility to the OEM.

Utilizing from 1 to 32 nodes the OEM can build their entire electrical system from the ground up. Integrate stand alone sub-systems such as door interlocks, climate control and voltage monitoring. The System Designer™ software gives you the flexibility to use any input or output the way you need to. Don't be held hostage by companies providing "custom programming" that require you to rely on them for changes. With V-MUX® you have SRP (Self Reliant Programming) at your finger-
