A click-through URL and two graphic elements are required: the dog ear which is the teaser (typically a 50 by 50 pixel ad) and the page peel which is revealed when rolling over the teaser (typically 640 pixels in width and 480 pixels in height).

Guidelines to book HTML/HTML5 banners

- When booking an HTML banner in ADTECH IQ, do not build the basic structure of an HTML file (the elements html, head, title, body etc.). The banner will almost al- ways be delivered within a TAG that is part of the website with an existing HTML file structure.
- Put all necessary scripts within the index.html file (root directory).
- Put all files into the root directory, do not use a folder structure.
- Use unique identifiers, classes, variables and function names per banner.
- Use adserver variables only within the index.html file. The adserver will not replace adserver variables within .js files, additional HTML files or any other file types.
- Adserver variables are used for example to count clicks or to define the correct path to images.
- One option for linked files could be to store the necessary files on a server and to use the absolute path.

HTML banner code example with adserver variables

Charset settings for HTML/HTML5 banners

When booking an HTML banner in ADTECH as index.html file the default Charset is set to UTF-8 and should not be changed, unless the website delivering the banner is using a different charset code. Available charset options are:

- UTF-16
- UTF-8
- US-ASCII
- ISO08859-1
- ISO08859-2
- ISO08859-3
