

# RTSA 7500

## Real Time Spectrum Analyzer

Programmer's Manual  
Version 3.6.2

## **Important notice**

The information in this guide is furnished for informational use only and is subject to change without notice. Berkeley Nucleonics Corporation assumes no responsibility or liability for any errors or inaccuracies that may appear in this document.

No part of this publication may be reproduced, published, stored in an electronic database, or transmitted, in any form or by any means, electronic, mechanical, recording, or otherwise, for any purpose, without the prior written permission of BNC Corporation.

## **Trademarks**

BNC, the BNC logo and RTSA 7500 are trademarks of Berkeley Nucleonics Corporation.

The following are trademarks or registered trademarks of their respective companies or owners:

Windows, Windows XP / Microsoft Corporation

All other brand or product names are trademarks or registered trademarks of their respective companies or owners.

## **Berkeley Nucleonics Corp**

2955 Kerner Blvd.  
San Rafael, CA 94901  
(415) 453-9955

## **HARDWARE WARRANTY AND LIMITATION OF LIABILITY**

### **Read this warranty carefully before you use the product.**

RTSA7500 Real Time Spectrum Analyzers are warranted for workmanship and materials for a period of one (1) year from the date of shipment as identified by the Customer's packing slip or carrier waybill. BNC reserves the right to void the warranty on any equipment that has been altered or damaged due to Customer negligence, unauthorized repair, misuse of equipment, evidence of physical or environmental damage, transportation abuse or removal of any BNC identification labels or serial numbers.

It will remain the responsibility of the Customer, having obtained a Return Material Authorization (RMA) and shipping instructions from BNC, to return, at the Customer's expense, the defective unit to BNC's repair facilities. BNC will incur shipping charges for the return of warranty repaired equipment. The RMA number can be secured by calling BNC Customer Service and Support (+1.800.234.7858). If the product does not fall within BNC's warranty period or the product is found to be functioning as designed, then under the terms of BNC's warranty policy, all costs of repairs and shipping will be charged directly to the Customer. BNC will warrant repaired units for a period of 90 days from date of shipment from BNC to the Customer. If the remaining period on the original hardware warranty is greater than 30 days, then BNC will honor this remaining warranty period.

BNC EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES AND CONDITIONS, WHETHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, WARRANTIES, CONDITIONS OR REPRESENTATIONS OF WORKMANSHIP, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, DURABILITY, OR THAT THE OPERATION OF THE HARDWARE OR LICENSED SOFTWARE WILL BE ERROR FREE. IN NO EVENT WILL BNC BE LIABLE FOR INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

## **USE OF PRODUCTS IN HIGH RISK ACTIVITIES**

BNC PRODUCTS ARE INTENDED FOR STANDARD INDOOR COMMERCIAL USE. WITHOUT THE APPROPRIATE NETWORK DESIGN ENGINEERING, THEY MUST NOT BE USED FOR ANY "HIGH RISK ACTIVITY", as described in this paragraph. Customer acknowledges and agrees that the products supplied hereunder are not fault-tolerant and are not designed, manufactured or intended for use or resale as on-line control equipment in hazardous environments requiring fail safe performance including but not limited to the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines, or weapons systems, in which the failure of products could lead directly to death, personal injury, or severe physical or environmental damage, all of which are examples of "High Risk Activity". BNC AND ITS SUPPLIERS EXPRESSLY DISCLAIM ANY EXPRESS OR IMPLIED WARRANTY OF FITNESS FOR HIGH RISK ACTIVITIES.

## **GNU General Public License**

This device contains free firmware: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version. This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details. GNU General Public License is available at <http://www.gnu.org/licenses>.

# Preface

---

This preface describes the audience for, the organization of, and conventions used in this document. It also identifies related documentation and explains how to access electronic documentation.

## Audience

This document is written for software developers wishing to develop and/or maintain a software interface to the RTSA7500 and who have a basic understanding, familiarity and experience with network test and measurement equipment.

## Conventions

This section describes the conventions used in this document.

### Grayed-out Font

Indicates a command or a feature is not yet available in the current release.

### Courier Font

Illustrates this is an example for a command or a concept.

### Light Blue Font

Contains hyperlink to the referenced source that can be clicked on.

### Normal Bold Font

When used within a sentence or a paragraph, it emphasizes an idea to be paid attention to particularly.

### Red Font

Conveys special information of that section.

**Note:** This symbol means **take note**. Notes contain helpful suggestions or references to additional information and material.

---

**Caution:** This symbol means **be careful**. In this situation, you might do something that could result in equipment damage or loss of data.

---

**Warning:** This symbol means **danger**. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with the standard practices for preventing accidents.

---

## Obtaining Documentation and Releases

You can access the most current BNC documentation at release bundles at <http://www.berkeley-nucleonics.com/support/model-7500-support-resources>.

## Document Feedback

Please send your comments about this document or our other documentation to [support@berkeleynucleonics.com](mailto:support@berkeleynucleonics.com).

Thank you, we appreciate your comments.

## Obtaining Technical Assistance

The BNC Support website provides online documents for resolving technical issues with BNC products at this URL: <http://www.berkeleynucleonics.com/model-7500>  
For all customers who hold a valid end-user license, BNC provides technical assistance 9 AM to 5 PM Eastern Time, Monday to Friday. Contact us at ***microwavesupport@berkeleynucleonics.com*** or by calling **+1.415.453.9955** or **+1.800.234.7858**.

Before contacting Support, please have the following information available:

- RTSA7500's serial number. The serial number S/N is located on the identification label on the RTSA7500's underside;
- version of BNC firmware you are using, potentially including version of GUI and/or API libraries to third-party applications; and
- the operating system you are using.

# RTSA7500 Functional Overview

This section overviews the RTSA7500's functionality and protocols used, and summarizes the SCPI command sets for controlling the individual functions.

**Note: This is a living and evolving document. We welcome your feedback.**

The features and functionality described in this section **may** exist in the current product firmware release or are scheduled for a future product firmware release (grayed out commands and/or text). Please refer to Appendix F: SCPI Commands Quick Reference for the complete list of commands and the availability information. No hardware upgrade is required at each feature release (unless specified though unlikely).

## System Overview

The Model 7500 Real Time Spectrum Analyzer is a high-performance software-defined RF receiver, digitizer and analyzer, as illustrated in [Figure 1](#). With patent-pending software-defined RF receiver technology, the RSTA 7500 provides industry leading combined sensitivity, tuning range, instantaneous bandwidth (IBW) and scan rate. Additionally, it provides real-time sophisticated triggering and capture control.

The Model 7500 is designed for stand-alone, remote and/or distributed wireless signal analysis. It is ideal for monitoring, management and surveillance of transmitters, whether they are in-building or spread across a geographic area. Applications include, but are not limited to:

- spectrum analysis, wireless network management and interference mitigation;
- cognitive radio and white space spectrum sensing, enterprise wireless signal intrusion detection (WSID);
- government spectrum licensing monitoring and enforcement;
- technical security counter measures (TSCM) and military communications and signals intelligence (COMINT/SIGINT and CEW).

The RSTA 7500 hardware largely consists of:

- a hybrid super-heterodyne and direct-conversion RF receiver front-end (RFE);
- receiver front end inputs and outputs to support clock synchronization, direct digitization input, and IF output for high-end digitization;
- a 125 MSample/sec 12-bit (or 14-bit as a population variant) wideband (WB) ADC with a dynamic range of about 70dB;
- a 300 kSample/sec 24-bit narrowband (NB) ADC with a dynamic range in excess of 100dB;
- a large Xilinx FPGA with embedded MicroBlaze microprocessor, Gigabit Ethernet interface and custom embedded digital signal processing (DSP) logic;
- 128 or 256 MB of DDR3 for real-time caching of digitized data; and
- a general purpose input/output (GPIO) port.

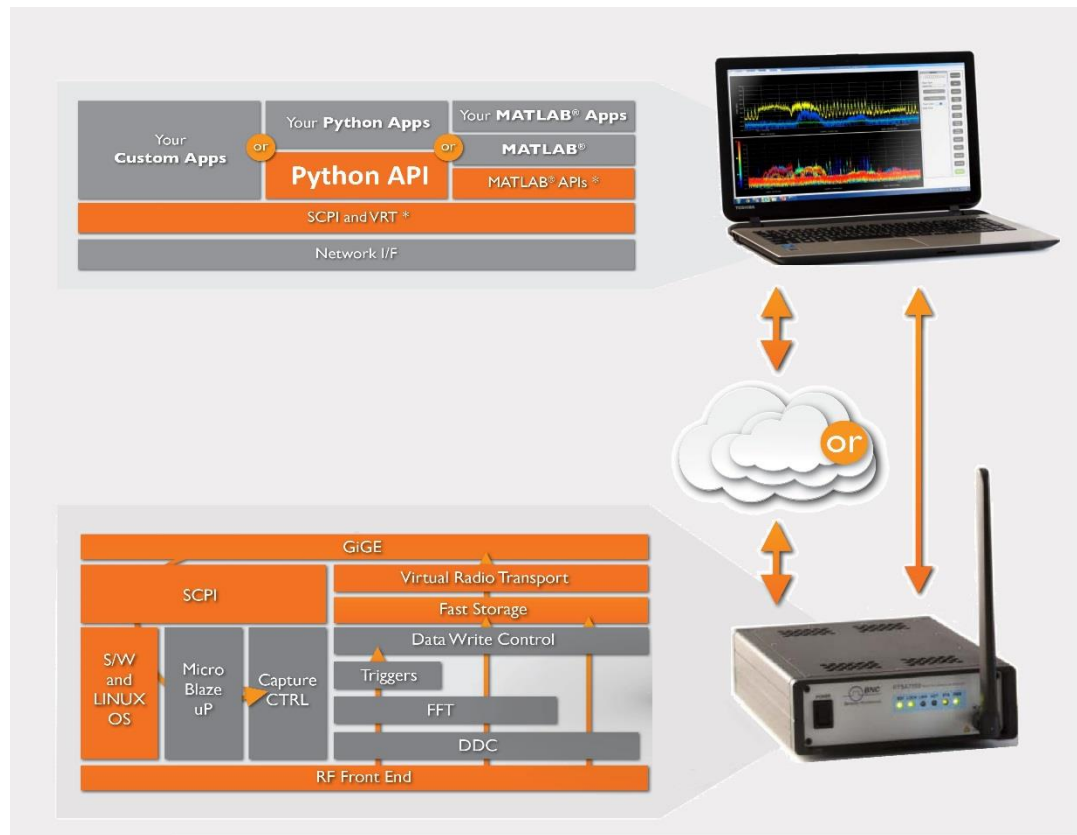

Figure 1: RTSA7500 Functional Block Diagram

BNC's products conform with standardized protocols for interoperability. BNC provides application programming interfaces (APIs) designed for easy integration with third-party applications. Standard protocols include the Standard Commands for Programmable Instruments (SCPI) protocol for controlling and obtaining status from the 7500 and the VITA-49 Radio Transport (VRT) protocol for digitized data and its associated context information.

In addition, API libraries, written in C/C++, Python and MATLAB, are provided for quick interfacing, data acquisition and as well as for spectral analysis with MATLAB® applications. The Python API is open-source under BSD licensing. Python API handles the low-level details of real-time acquisition, signal processing and visualization, and provides feature rich libraries, example applications and source code, all specific to the requirements of signal analysis. Usage examples are provided through the available source codes of the Graphical User Interfaces (GUI) or any applications included in each release package.

Refer to [Appendix A](#) for how to connect to a RTSA 7500 and [Appendix B](#) for the protocol on how to find any 7500's available on the local network. The source code provided for the aforementioned APIs and GUIs/applications would serve as examples.

The RTSA 7500 provides system level control and status commands as defined in [Table 1](#).

Table 1: System Level Control/Status Commands

SCPI Command	Description
<b>:SYSTem</b>	<i>Page 46</i>
:ABORT	Aborts the current data capturing process and puts the system into a normal manual mode (i.e. sweep, trigger, and streaming will be aborted)
:CAPability?	Returns a list of the RTSA7500's capabilities including firmware versions and installed hardware options
:CAPTure	
:MODE?	Gets the current capture mode of the RTSA 7500 (i.e. sweeping, streaming or block mode)
:COMMunicate	
:LAN<commands>	Subset of commands for configuring/querying RTSA 7500's LAN settings
:ERRor	Returns the error code and messages from the SCPI error/event queue
[:NEXT]?	
:ALL?	
:FLUSH	Clears the RTSA 7500's internal data storage buffer of any remaining data that has not transferred out of the RTSA 7500
:LOCK	
:HAVE?	Returns the current lock state of the task specified
:REQuest?	Requests the RTSA 7500 to provide a lock on a specific task such that only the application that has the lock can perform the task
:OPTions?	Returns comma separated 3-digit values to represent the hardware option(s) or features available with a particular RTSA 7500 model
:SYNC	
:MASTer[?]	Sets a RTSA 7500 unit to be the master or slave for a synchronization trigger system with multiple units. Affects :TRIGger:TYPE PULSe or WORD.
:WAIT[?]	Sets the delay time in nanoseconds that the system must wait after receiving the trigger signal before performing data capture
:VERsion?	Returns the SCPI version number that the instrument complies with
:DATE[?]	Sets/reads date
:TIME[?]	Sets/reads time
:ADJust	Adjust the system time relative to it's current time
:MODE[?]	Synchronize one time only or continuously
:SYNC[?]	Sets/ gets the System time synchronization source via network or SCPI, or disable
:STATus?	Status of the time synchronization
<b>:STATus</b>	<i>Page 56</i>
:OPERation	Returns the standard Operation Status Register (OSR) for any event
[:EVENT]?	
:CONDition?	
:ENABle[?]	
:PRESET	Presets the RTSA7500 (similar to *RST)
:QUESTionable	Returns the standard Questionable Status Register (QSR) for any event
[:EVENT]?	

---

SCPI Command	Description
:CONDition?	
:ENABle[?]	
:TEMPerature?	Returns the RTSA7500's internal ambient temperature

---

See SCPI Command Set section (page [42](#) onward) for further details on the commands.

---

**Caution pertaining to multi-user:** The current firmware version of the RTSA7500 allows multiple applications to connect to the unit simultaneously but it does not support independent sessions. Therefore, the actions of one user may over-write those of another. This could potentially damage the unit for instance if the front-end's gain were incorrectly set. If multiple applications are connecting to the unit, it is advised that only one of those is controlling the unit at any time.

---

## The Architecture

The RTSA7500 is an integrated wireless radio receiver and digitizer/analyzer. It has an embedded capture controller that enables users to:

- define and execute real-time and sophisticated triggers, traces and sweeps;
- configure the radio RFE and DSP in association with those traces or sweeps;  
and
- time-stamping and data output for captures.

Traces and sweeps are controlled by the capture controller as illustrated in the lower portion of [Figure 2](#). A trace and a sweep are defined as a single (block or continuously streamed) capture and a series of captures, respectively, each with their associated hardware configurations.

Figure 2: RF Receiver Front-end and Capture Controller Functional Block Diagram

The RTSA7500 supports different RFE modes of operation and subsequent DSP capabilities as per Table 2 and as described in the following subsections.

Table 2: Radio RFE Modes and DSP Data Output Formats

Mode <sup>0</sup>	Description	Freq Range (MHz)	IBW (MHz)	DSP Data Output Format <sup>1</sup>		
				None	CIC/Dec	Frequency Shift
ZIF	Zero-IF Receiver	50 - max	100	I14 Q14	I14 Q14	I14 Q14
SH	Super-Heterodyne Receiver	50 - max	40 <sup>2</sup>	I14	I14 Q14 <sup>4</sup>	I14 Q14
SHN <sup>3</sup>	SH Receiver with narrower BW	50 - max	10	I14	I14 Q14 <sup>4</sup>	I14 Q14
HDR	High Dynamic Range Receiver	50 - max	0.1	I24	-	-
DD	Direct Digitization Receiver	0.1 - 50 <sup>6</sup>	50	I14	I14	I14 Q14
IQIN <sup>5</sup>	External IQ Input	0.1 - 50 <sup>6</sup>	100	I14 Q14	I14 Q14	I14 Q14
HIF <sup>7</sup>	High IF Receiver	50 - max	--	-	-	-

<sup>0</sup> The RFE Mode availability is product dependent.

<sup>1</sup> The RTSA7500 supports a 12-bit or 14-bit WB ADC as a manufacturing population variant. The least significant bits of the 14-bit data representations are zeroed when the RTSA 7500 is populated with the 12-bit WB ADC, hence, the subscript of 14 for IQ or I.

<sup>2</sup> The 40MHz SH is only available in RTSA 7500 product version 1.3 (hardware revision 3) and higher. Revision 2 hardware value varies between 30 or 35MHz, contact BNC's Support for further details. See \*IDN? to find out your hardware/product version (or the Administrative web-console to the box).

<sup>3</sup> SHN mode is only available in RTSA 7500 product version 1.3 (hardware revision 3) and higher. See \*IDN? to find out your hardware/product version (or the Administrative web-console to the box).

<sup>4</sup> For SH and SHN modes, when the decimation is used, a frequency shift of 35MHz for non-WBIQ models and 55MHz for WBIQ models will be applied automatically to bring the RTSA7500's center frequency back to the zero IF. Thus, the data output will be I and Q.

<sup>5</sup> IQIN mode is not available in RTSA 7500 product version 2.2 and higher. See \*IDN? to find out your product version (or the Administrative web-console to the box).

<sup>6</sup> In DD and IQIN modes, there is no frequency tuning except for performing frequency shift. When decimation is applied, the decimation will be around the zero frequency.

<sup>7</sup> The HIF mode is only available for RTSA 7500-XXX-HIF product model and is indicated by the :SYSTem:OPTions? command's response code 002.

RTSA 7500 complies to VRT protocol for sending digitized IF data packets and their associated context information depending on the capture mode. It is very important to follow the VRT's IF Data Packet Class section (page 36) for the exact VRT data output formats as well as packing method.

## RF Receiver Front-End

The upper portion of [Figure 2](#) shows a block diagram of the RFE within the RTSA 7500. The architecture consists of a super-heterodyne (SH) front-end with a back-end that utilizes an I/Q mixer similar to that in a direct-conversion (or zero-IF) receiver.

Depending on the frequency of the signals being analyzed, one of the three receiver signal processing paths is selected. Signals in the frequency range 100kHz to 50MHz are directly digitized, while all other signals are translated to the frequencies of the first IF block via one of the other two signal processing paths. The IF block consists of a bank of multiple SAW filters. SAW filter selection depends on the frequency of the input signal. The output of the SAW filter feeds the I/Q mixer.

The three signal processing paths are further classified into different modes of operation for the capture engine as shown in [Table 2](#). The radio modes ZIF, SH, SHN and HDR support tuning the center frequency from 50MHz to the maximum frequency supported by the particular product model (ex. 8GHz, 18GHz, 20GHz, and 27GHz for RTSA7500-08, RTSA7500-18, RTSA7500-20, and RTSA7500-27, respectively).

The ZIF, SH and SHN radio modes support a tuning resolution of 10Hz. Digital frequency shifting can then be used to enhance the tuning resolution to the nearest 1Hz ( $\pm 0.23$ Hz). The frequency shifting technology used is an embedded Numerically Controlled Oscillator (NCO) (a Direct Digital Synthesizer or DDS) as described in the Digital Down Converter subsection (page 20).

The HDR radio mode supports a tuning resolution of 10Hz. No further fine tuning is available.

The remaining two radio modes, DD and IQIN, support 50MHz IBW direct digitization of the baseband from the external RF IN or I and Q IN ports, respectively. Hence, neither

of these modes support frequency tuning of the radio although the DSP's frequency shift mode may be applied.

## Direct-Conversion Receiver Technology

Direct-conversion (or ZIF) receivers are ideal for signal analysis of wideband waveforms, such as 4G/LTE, Wi-Fi and Bluetooth. With that benefit comes the drawback of both IQ and DC offsets which are inherent to direct-conversion technology.

### DC Offset Correction

The RTSA7500's WB ADC sampling rate is 125 MSa/s, intermediate frequency (IF) is 0 and the entire IF bandwidth is 125MHz. The analog filter results in an amplitude roll-off at approximately  $\pm 50$ MHz around the center frequency  $F_c$ , as illustrated in [Figure 3](#).

Direct-conversion receivers have a DC offset at the center of the band. The offset is primarily compensated for in real-time in the receiver hardware but there always is some residual offset that (depending on the application and bandwidth of interest) might need to be compensated for in software. Several options such as calibration or dynamic offset compensation in software have been described in the open literature.

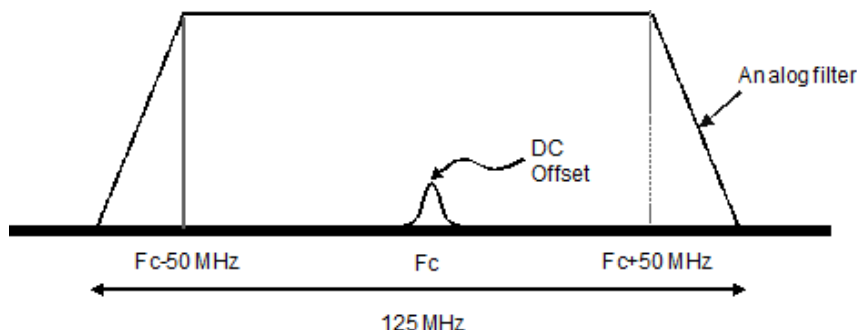

Figure 3: DC Offset with Amplitude Roll-Off at  $\pm 50$ MHz

If the application only needs to utilize up to 50MHz of IBW, a simple alternative to DC offset compensation is to use the SH mode of operation.

### IQ Offset Correction

Direct-conversion receivers have phase and/or amplitude offsets between in-phase (I) and quadrature (Q) components of the baseband signal. Due to this, when an FFT is performed on digitized baseband data where there is a signal tone present, there will be an 'image' at the same frequency offset from the center frequency as the tone itself. This is illustrated in [Figure 4](#).

To compensate for this, the raw I and Q data must be processed according to the following "calibrateIQ" routine, illustrated using the following MATLAB® code. When an FFT is performed on the output of calibrateIQ, the image will disappear. This process has no impact on the accuracy or precision of the data.

```
%%%%%%%%
% MATLAB code for IQ Offset Correction
%%%%%%%%

function [calibratedQ] = calibrateIQ(iData, qData)
    numberOfSamples = size(iData, 1);
```

```

sumOfSquaresI = sum(iData.^2);
sumOfSquaresQ = sum(qData.^2);
amplitude = sqrt(sumOfSquaresI * 2 /
numberOfSamples);
ratio = sqrt(sumOfSquaresI / sumOfSquaresQ);
p = (qData/amplitude) * ratio .* (iData/amplitude);
sinphi = 2 * sum(p) / numberOfSamples;
phi_est = -asin(sinphi);

calibratedQ = ((sin(phi_est) * iData) + (ratio * qData))
/ cos(phi_est);
end

```

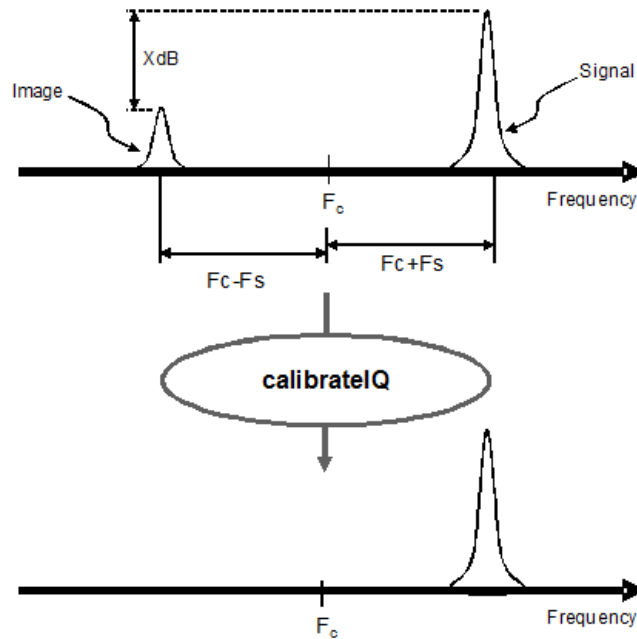

Figure 4: IQ Offset Correction

Table 3: RF Front-End Control/Status Commands

SCPI Command	Description
<b>:INPut</b>	<i>Page 59</i>
:ATTenuator[?]	Enables/disables the front-end's 20dB attenuation (on some models)
:VARiable[?]	Sets the variable attenuation for RTSA7500-418 and -427
:FILTer	
:PRESelect[?]	Enables/disables the use of preselect filtering
:GAIN	
:IF[?]	Sets the variable IF gain
:HDR[?]	Sets gain level for the NB ADC of the HDR signal path
:MODE[?]	Selects the receiver mode of operation
<b>:SOURce</b>	<i>Page 63</i>
:CLOCK	
:ADC[?]	Selects variable or fix input clock type to the WB ADC
:RATE[?]	Sets the clock rate for the WB ADC

SCPI Command	Description
:REFerence	
:PLL[?]	Selects the 10MHz reference clock source
:RESET	Resets the 10MHz reference selection to INTernal source
<b>[[:SENSe]</b>	<i>Page 63</i>
:CORRection	
:DCOFset[?]	Enables/disables the ADC's DC-offset correction system
:DECimation[?]	Sets the decimation rate as an exponent of 2 (i.e. rate = 2 <sup>level</sup> where level = 0, 1, 2 - 10)
:FREQuency	
:CENTer[?]	Sets the center frequency of the RFE
:IF?	Queries the IF frequencies that are used for the current input mode and center frequency
:INVersion?	Queries if a spectral inversion is required at a given frequency
:LOSCillator?	Gets the frequency to be set for the external LO 1 or 2 in corresponding to current the RTSA 7500's center frequency
:RESolution?	Gets the Analog PLL tuning resolution
:SHIFt[?]	Sets the frequency shift value (not available for HDR mode)
:LOCK	
:REFerence?	Queries the lock status of the PLL reference clock
:RF?	Queries the lock status of the RFE's PLL
<b>:OUTput</b>	<i>Page 67</i>
:IQ	
:MODE[?]	Selects the IQ output path to be from the external connector or the digitizer

See SCPI Command Set section (page 42 onward) for further details on each set of commands.

## Digital Signal Processing

The RTSA7500 has embedded DSP blocks to provide further signal processing capabilities, such DDC with up to 10 levels of decimation, and FFT computation.

### Digital Down Converter

The DDC block takes the frequency band of interest and shifts it down in frequency, then provides decimation of the sampling rate to one that is lower and consistent with the bandwidth of the signal of interest. This enables channelization of signals having bandwidth smaller than the IBW.

Referring to [Figure 5](#), the DDC has two major elements, an NCO (DDS) and a down sampling with filtering. The NCO generates a complex sinusoid, which is mixed with the IQ input using a complex multiplier, to shift or offset the signal spectrum from the selected carrier frequency. This process provides the frequency fine-tuning (and shifting) feature as mentioned in the previous subsections.

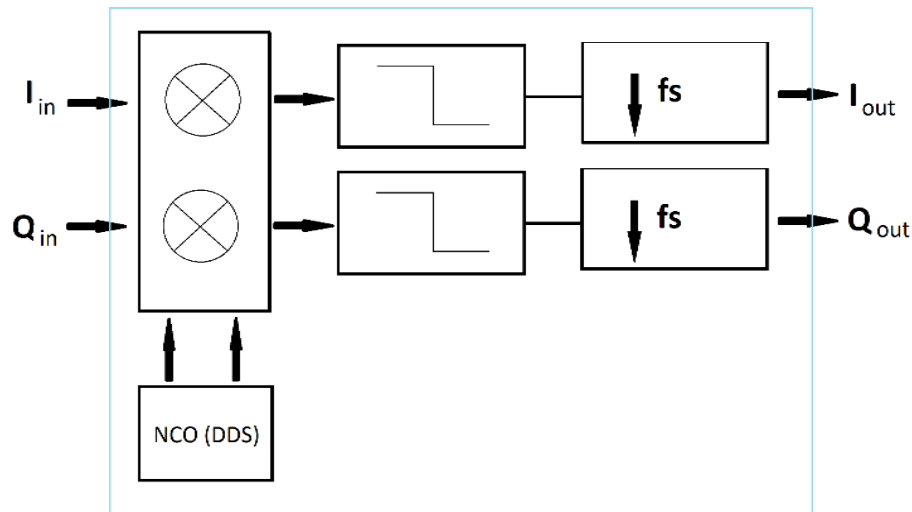

Figure 5: DDC Functional Block Diagram

The complex multiplication is then followed by either a finite impulse response (FIR) filter or cascaded integrator-comb (CIC) filters with a FIR filter combined. The CIC filter has a 'droop' associated with it in the passband. In order to compensate for this droop, the CIC filter is followed by a compensating FIR filter. Each filter type has its own decimator. This whole process effectively reduces the sample rate and filters the signal to remove adjacent channels, minimize aliasing, and maximize the received signal-to-noise ratio.

**Note:** The use of the NCO converts the in-phase signal (I data) input of the receiver's DD, SH and SHN processing paths to complex I and Q data output. See [Table 2](#).

## Triggers

Triggers provide a means of qualifying the storage of captured time domain IQ data based on an external, periodic or frequency domain event. Triggering can be considered a means of filtering signals of interest for the purposes of subsequent visualization and/or analysis.

The following describes the different types of triggers and their common controls. Selection of different types is mutually exclusive.

### Frequency Domain Triggering

Frequency domain triggering relies on the embedded real-time FFT mechanism to transform the sampled signal from the time domain to the frequency domain. The RTSA7500 uses a 1024 point real-time FFT core embedded within the FPGA to transform 1024 time domain IQ samples to 1024 frequency domain FFT bins. Each bin is an average of the spectral activity over a range of 125MHz divided by the DDC decimation rate divided by the 1024 FFT points.

The frequency domain triggering supported by RTSA7500 is a level trigger type, used to capture any signal above the noise floor within a specified frequency range. The user defines a single amplitude level within a frequency range. The frequency range encompasses all FFT bins with center frequencies within the range defined by START

and STOP. If the sampled signal amplitude exceeds the defined trigger level at any single sample within the defined frequency range, the trigger will occur and the subsequent IQ data capture will proceed.

Figure 6 illustrates the association of the time domain and the frequency domain. The internal frequency domain data lags the time domain data by 1024 samples at the rate of 125 MSa/s. After a trigger event is detected, the subsequent time domain IQ data is then stored to memory.

Figure 6: Association between Time and Frequency Domain

The measurable range of the input signal, and the corresponding allowable trigger level range, varies depending on the selected center frequency, the calibrated reference level and the attenuation setting. When the attenuation is in the circuit (:INPut:ATTenuator ON), the maximum trigger level to use is -10dBm; and when the attenuation is out (:INPut:ATTenuator OFF), the maximum is -30dBm. The threshold error is approximately -3dBm or less when the trigger level is 20dBm above the noise floor. When the level is within 20dBm of the noise floor, the threshold error increases as the signal gets closer to the noise floor.

**Note:** The threshold error is relative to the measured input signal level, which is dependent on the calibrated reference level. The reference levels could be custom calibrated to best fit a user's application, see the "AppNote – How to calibrate RTSA7500" document listed on the BNC website for more information.

See TRIGger Commands section (page 69) or SWEEp's trigger (page 80) for further details.

## Periodic Triggering

Periodic triggering provides a means of capturing a defined amount of IQ data on a periodic basis. Periodic triggering is typically used for statistical analysis of the captured signal.

*Commands related to this feature are not available in this release.*

## External Triggering

External triggering provides a means of synchronized triggering based on the receiving of a trigger signal provided via the RTSA7500's GPIO. The trigger "signal" could be a single pulse or a sync-word. See Synchronized Sweep (page 26) for additional details.

**Caution:** Contact BNC's Support for details on how to use the GPIO port prior to connecting anything to the port.

Table 4: Trigger Control/Status Commands

SCPI Command	Description
<b>:TRIGger</b>	Page 69
:TYPE[?]	Sets or disable the trigger type including LEVel   PERiodic   PULSe   WORD   NONE
:LEVel[?]	Sets the frequency range and amplitude of a frequency domain level trigger
:PERiodic[?]	Sets the time period of a periodic trigger
:STATus?	Returns the status of the active trigger as to whether it is pending or has occurred

See TRIGger Commands section (page 69) or SWEEp's trigger (page 80) for further details.

## Capture Controller

The Capture Controller provides a means of defining and performing simple traces and complex sweeps. For example, it allows for:

- the definition and execution of a complex sweep;
- the interruption of that sweep;
- the execution of a specific trace; and
- the resumption of the previous sweep.

**Caution:** The configurations of the capture engine associated with :TRACe and :SWEEp commands are fully independent of each other. A :TRACe command uses the configurations of the capture engine based on the root :INPut, :SENSe and :TRIGger commands. It does not use the configurations based on the :SWEEp command subset.

## Trace Capture Control

The :TRACe capture control initiates the capture, storage and conditionally the sending of IQ data through triggering when used. It supports both streaming and block mode capture.

The :TRACe:BLOCK command initiates a block capture of continuous IQ data (available to be "pulled" from the RTSA 7500 per command issued). Once it is issued, data will be stored instantly (conditional on triggering), contiguously and reliably and are available to be read. The maximum size of a block is limited by the memory device in the RTSA 7500.

The :TRACe:STReam command initiates the streaming of IQ data (which is "pushed" from the RTSA7500). Once it is issued, data packets will be sent instantly (conditional on triggering) and continuously on best effort basis (in other words, data might not be continuous from one packet to the next once the internal buffer is full).

The execution of the trace capture could be conditioned by the triggering. The triggering may be enabled or disabled via the :TRIGger:TYPE command, thereby, supporting free-run or triggered signal searches.

Table 5: Trace Capture Control Commands

SCPI Command	Description
:TRACe	Page 70
:BLOCK	
:DATA?	Initiates the sending of the IQ data captured
:PACKets[?]	Sets the number of IQ data packets to be captured per block (a block = :PACKets * SPP)
:SPPacket[?]	Defines the number of samples per VRT packet
:STReam	
:STARt	Initiates the capture, storage and streaming of IQ data
:STOP	Stops streaming

See TRACe Commands section (page 70) for further details.

## Sweep Capture Control

The :SWEep capture control provides the ability to define and execute simple or complex sweeps. A sweep setup consists of defining a list or multiple lists and executing one of the defined lists, with each list consisting of one or more entries storing different capture engine configurations. A list may be edited, deleted and/or executed using the :SWEep:LIST command set.

The :SWEep:ENTRy commands provide the ability to define the capture engine configurations equivalent to most of :INPut, :SENSe, :TRACe and :TRIGger commands for each sweep entry. Sweep entries are identified by an index number and may be inserted, edited and/or deleted like rows in a table or spreadsheet.

There are slight differences between the configuration options for trace versus sweep captures. The sweep allows for definition of a range of center frequencies whereby the center frequency is incremented in frequency by a step value. Level triggers may be defined over the entire range of center frequencies. Sweeping does not support time delayed triggers.

In addition, sweep mode data packets, whether VRT context or digitized data, are "streamed" or "pushed" from the RTSA 7500 (similar to :TRACe:STReam).

Table 6: Sweep Capture Control/Status Interface

SCPI Command	Description
<b>:SWEep</b>	<i>Page 73</i>
<b>:LIST</b>	
:CREAtE	Creates a new list identified by a unique string identifier
:DELETE	Deletes the current list
:EDIT[?]	Sets the current list of which all subsequent :LIST commands pertain to
:ITERations[?]	Defines the number of times the list is repeated during execution
:START	Begins execution of the current sweep list from the first entry
:STATus?	Get the current sweep status
:STOP	Stops execution of the current sweep list
<b>:ENTRY</b>	<i>All entry commands operate on the current list</i>
:COpy	Copies the settings of an existing sweep entry into the current settings for quick editing
:COUNT?	Gets the number of entries available in the list
:DELETE	Deletes the specified entry or all entries
:NEw	Sets the sweep entry settings to default values
:READ?	Gets the settings of an existing sweep entry
:SAVE	Saves the current editing entry to the end of the list or before the specified ID location in the list when the integer value is given
:ATTenuator	Enables/disables the front-end's 20dB attenuation
:DECimation[?]	As defined in [:SENSE]:DECimation, page 64
:FILTer	
:PRESelect[?]	As defined in :INPut:FILTer:PRESelect, page 60
:FREQuency	
:CENTer[?]	Defines the center frequency of the RFE or a range of frequencies that are stepped by the value defined by the :FREQuency:STEP
:STEP[?]	Defines the amount of frequency that the center frequency is stepped by
:SHIFt[?]	As defined in [:SENSE]:FREQuency:SHIFt, page 66
:GAIN	
:IF[?]	As defined in :INPut:GAIN:IF, page 61
:HDR[?]	As defined in :INPut:GAIN:HDR, page 61
:MODE	As defined in :INPut:MODE, page 62
:DWELl[?]	Sets the maximum amount of time waited for a trigger to occur after which the trigger is aborted
:PPBlock[?]	Same as :TRACe:BLOCK:PACKets, page 71
:SPPacket[?]	As defined in :TRACe:SPPacket, page 72
:TRIGger	
:TYPE[?]	As defined in :TRIGger:TYPE, page 69
:LEVel[?]	As defined in :TRIGger:LEVel, page 69
:PERiodic[?]	As defined in :TRIGger:PERiodic, page 70

See SWEep Commands section (page 73) for further details.

## Synchronized Sweep

The RTSA7500 supports a synchronized sweep function for the purposes of comparing the same signal received via multiple RTSA7500s.

Synchronized sweep is an extension of the external trigger capability. One of the RTSA7500s in a network is configured to be the master (:SYSTem:SYNC:MASTer ON) and the other RTSA7500s are configured as slaves (:SYSTem:SYNC:MASTer OFF). The master and slaves are configured with a sweep list, in which each sweep entry has a synchronization trigger type (:SWEep:ENTRy:TRIGger:TYPE PULSE | WORD). The synchronization trigger is generated and delivered from the master's GPIO to that of the slaves to indicate the beginning of a capture.

Figure 7 provides a synchronization trigger example using sync-word. The master sends the sync-word when the setup of its front-end has been completed. Master and slaves are also individually configured with a delay variable (:SYSTem:SYNC:WAIT <nsec> with a resolution of 8 nsec). This delay wait time accounts for the typical worst-case front-end setup time and for differences in the synchronization cable length. Master and slaves then begin the capture upon the expiration of the wait (or delay).

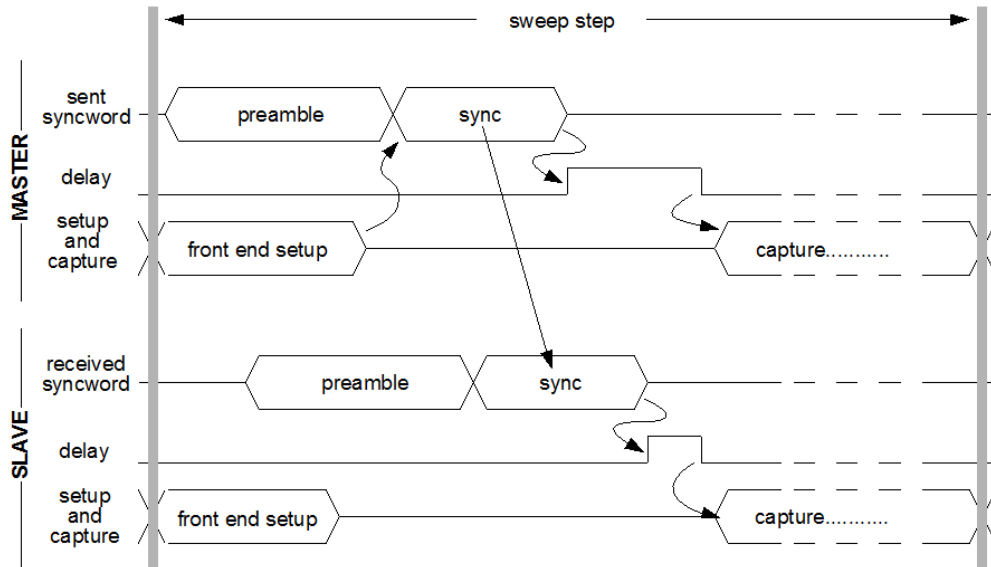

Figure 7: Synchronized Sweep using Sync-Word

The front-end setup time is typically of approximately 200 usec but is variable due to the embedded running processes. Referring to Figure 8, if the front-end setup time on one (or more) of the slaves is longer than the combined duration of the master's setup time plus the sync-word plus the slave's delay, then the slave will miss the beginning of the capture. The host-side application that is collating the capture data may recognize the missed capture by noting the timestamps and/or frequency of the capture data within the associated VRT Receiver Context packets. The rate of sweep versus the amount of missed captures may be balanced by adjusting the delay values.

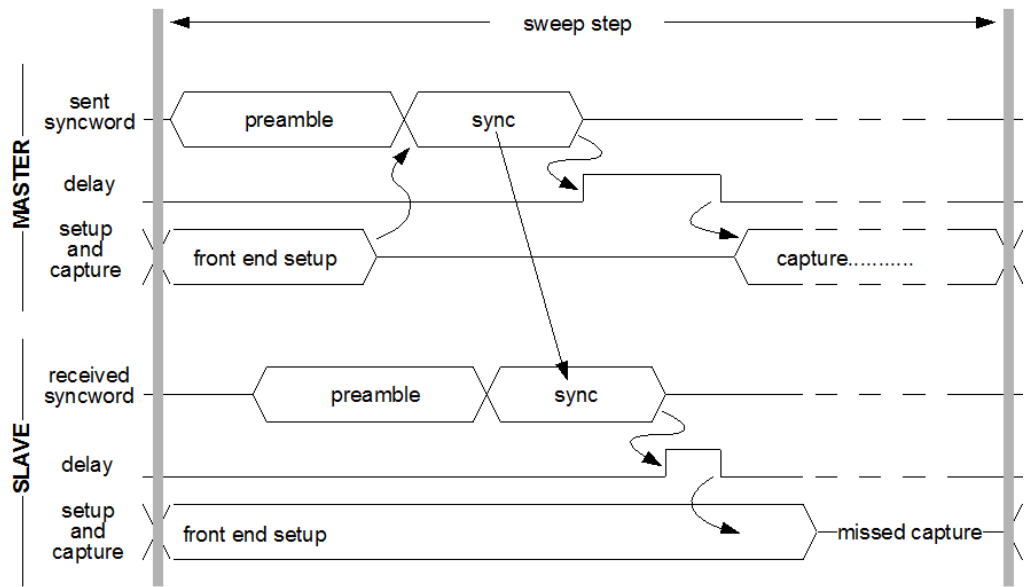

Figure 8: Synchronized Sweep with a Missed Capture

See SWEep Commands section (page 73) for further interface details.

# VITA-49 Radio Transport Protocol

The section describes the RTSA7500's VRT Information Class as per the "VITA Radio Transport (VRT) Draft Standard" Specification VITA-49.0 – 2007 Draft 0.21.

## Purpose

Convey an arbitrary 100MHz of IF data and associated information from the RTSA7500 to another equipment using an industrial standard.

## RTSA7500's VRT Overview

BNC's VRT supports four different packet streams of information defined and organized as shown in Figure 9 and Table 7. The streams of packets are sent when the data capture is started. The context packets carry the RTSA7500 settings information associated with the immediate following IF data packets.

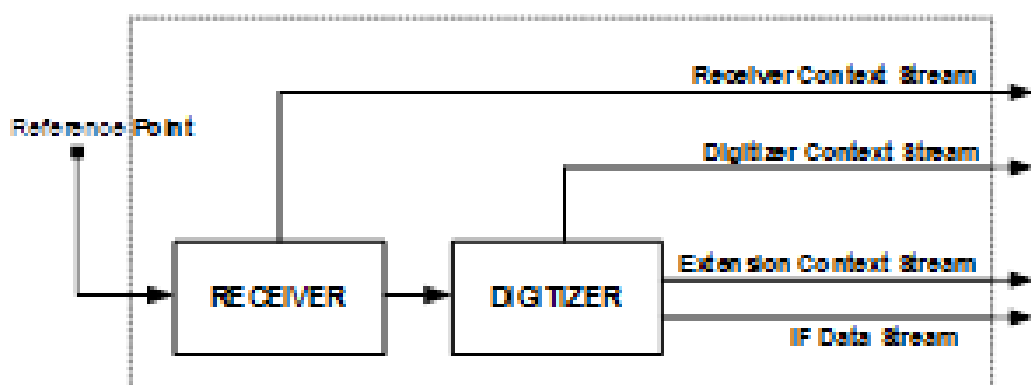

Figure 9: Connectivity and 4 Different Packet Streams Supported by RTSA7500

Table 7: The Categories of VRT Packet Streams Supported by BNC's RTSA7500

Contents	Standard Formats	Custom Formats
Context	<p><b>IF Context Packet Stream</b> conveys metadata concerning IF Data Packet Stream and the settings</p> <ul style="list-style-type: none"> <li>- Digitizer Context Packet Class Stream</li> <li>- Receiver Context Packet Class Stream</li> </ul>	<p><b>Extension Context Packet Stream</b> conveys additional Context concerning IF or Extension Data Packet Stream</p> <ul style="list-style-type: none"> <li>- Extension Context Packet Class Stream</li> </ul>
Data	<p><b>IF Data Packet Stream</b> conveys discrete time sampled signal data</p> <ul style="list-style-type: none"> <li>- IF Data Packet Class Stream</li> </ul>	<p><b>Extension Data Packet Stream</b> conveys any signal or data derived from a signal</p> <ul style="list-style-type: none"> <li>- Currently not used</li> </ul>

### Receiver Context Packet Class Stream

The Receiver Context Packet Class Stream is used to convey informational messages about changes in the configuration and status of the RF receiver in the RTSA7500.

### Digitizer Context Packet Class Stream

The Digitizer Context Class Stream is used to convey information messages about changes in the configuration and status of the IF digitizer in the RTSA7500.

### Extension Context Packet Class Stream

The Extension Context Packet Class Stream is used to convey metadata for the IF Data Packet Stream, which no provision has been made in the IF Context Packet Stream.

### IF Data Packet Class Stream

The IF Data Packet Stream is used to convey complex IQ samples from the digitizer to devices external to the RTSA7500.

[Table 8](#) summarizes numerically the list of Stream Identifiers used by BNC for different Packet Class Stream. Each ID will be mentioned in the subsequent corresponding Packet Class sections.

*Table 8:* A List of Stream Identifiers As Used by BNC for Different Packet Classes

Stream Identifier	Packet Class
0x90000001	Receiver Context
0x90000002	Digitizer Context
0x90000003	IF Data – {I <sub>14</sub> Q <sub>14</sub> } Format
0x90000004	Extension Context
0x90000005	IF Data – {I <sub>14</sub> } Format
0x90000006	IF Data – {I <sub>24</sub> } Format

## Packet Classes and Streams

This section describes in details the rules and structure of those Packet Classes and Streams. By definition, a series of packets instantiated from the same Packet Class form a Packet Stream.

---

**Note:** All data words in each VRT packets are in big-endian order, and sent MSB first.

---

### Receiver Context Packet Class

This Packet Class is a type of IF Context Packet Class. The packet information conveys changes in the configuration and status of the RTSA7500's RF receiver.

Table 9: Receiver Context Packet Class Structure

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Pkt Type 0 1 0 0				C	R	T S M		TSI	TSF	Pkt Count			Pkt Size																		
Stream Identifier (1 word)																															
Timestamp - Integer Seconds (1 word)																															
Timestamp - Integer Picoseconds (2 words)																															
Context Indicator Field (1 word)																															
Context Fields (Variable Size)																															

1. **Pkt Type** shall be set to **0100** to indicate this is context packet.
2. **C** shall be set to **0** to indicate there is no Class Identifier in the packet.
3. **R** shall be set to **00**, because they are reserved bits.
4. **TSM** (TimeStamp Mode) shall be set to **0**, indicating that context packet timestamps are precise.
5. **TSI** (TimeStamp-Integer) field shall be set to **01**, indicating that integer (seconds) part of the timestamps are in Coordinated Universal Time (UTC).
6. **TSF** (TimeStamp-Fractional) field shall be set to **10**, indicating that the fractional part of the timestamp measures in real time picosecond resolution.
7. **Pkt Count** shall start at 0000 and increment once for each context packet, until reaching 1111 (or 15), where it shall rollover to 0000 on the next count.
8. **Pkt Size** indicates the total number of 32-bit words in the entire context packet, including all headers, the context indicator field and context sections.
9. **Stream Identifier** shall be the 32-bit word, **0x90000001**
10. **Timestamp - Integer Seconds** shall be in UTC format and will represent the number of seconds occurred since Midnight, January 1, 1970, GMT.
11. **Timestamp - Integer Picoseconds** shall count the number of picoseconds past since the last increment of the Timestamp seconds field. See the Picosecond Timestamp Words Format section for the format.
12. The **Context Indicator Field** shall follow the format indicated in [Table 10](#).

Table 10: Receiver Context Indicator Field Positions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
I	R	-	F	-	-	G	-	-	-	-	-	-	T	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

13. The **Context Fields** section shall contain a context field for every field that is indicated to be present in the Context Indicator Field. *The fields shall be ordered in the identical order of their occurrence in the Context Indicator Field.* See [Table 11](#) for the definition and associated value of each field.

Table 11: Receiver Context Field Definition and Values

Bit Name	Context Field	# of Words in Field	Period of Validity
I	Context Field Change Indicator	0	N/A
R	Reference Point	1	Persistent
F	RF Reference Frequency	2	Persistent
G	Gain	1	Persistent
T	Temperature	1	Persistent

## Context Field Change Indicator

The Context Field Change Indicator is used to indicate when some context value of the system has changed. One or more of the other bits in the indicator field will be also set, indicating which values have been changed and have their updated values in the context fields that follow. It is possible that a context packet may be sent where the Context Field Change Indicator is set to 0, indicating that no change has occurred.

## Reference Point

The Reference Point is used to indicate a point at which other context packets can be taken from as a reference. In this system, it is used to indicate which antenna port has been selected to receive signals.

When field R is marked in Receiver Context Indicator Field, one of the following values is stored in the Context Field to indicate which the signal source used:

- 0x01000001 – reference point P1 (antenna port 1),
- 0x01000002 – reference point P2 (antenna port 2),
- 0x01000004 – internal calibration signal.

## RF Reference Frequency

The RF Reference Frequency communicates the frequency of origin for the signal. The value of the RF Reference Frequency shall be expressed in units of Hertz. The RF Reference Frequency sub-field shall use the 64-bit, two's-complement format as shown in [Table 12](#). This field has an integer and a fractional part, with the radix point to the right of bit 20 in the second 32-bit word. This gives the RF Reference Frequency a range of  $\pm 8.79\text{THz}$  with a resolution of  $0.95\mu\text{Hz}$ .

Table 12: RF Reference Frequency Word Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Integer RF Reference Value (43..12), Hz																															
Integer RF Ref. Value (11..0), Hz																Fractional RF Reference Value(19..0)															

## Gain

The gain is a 32-bit value that is split into two 16-bit values, representing the Stage 1 and Stage 2 gain values. The Stage 1 gain represents the amount of gain in the front-end system, the RF gain. The Stage 2 gain represents the amount of gain in the back-end system, the IF gain.

Each gain value is a signed two's-complement number, having two sub-fields, bits 15:7 being the integer value, and 6:0 being the fractional value. This gives each gain figure a range of  $\pm 256\text{dB}$  with a resolution of  $1/128\text{dB}$  ( $0.0078125\text{dB}$ ).

Table 13: Gain Field Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Integer IF								Fractional IF								Integer RF								Fractional RF							

## Temperature

*This field is not yet available.*

The RTSA7500 has a temperature sensor and will report changes in temperature to the system. The value of the Temperature field shall be expressed in units of degrees

Celsius (°C). The Temperature field shall use the 32-bit format shown in Table 14 with the upper 16 bits reserved and shall be set to zero. The Temperature value shall be expressed in signed two's-complement format in the lower 16 bits of this field. This field has an integer and a fractional part, with the radix point to the right of bit 6.

Table 14: Temperature Field Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																Integer Temperature						Fractional Temp.									

The valid range of the Temperature field is -273.15 °C to +511.984375 °C. The resolution of the Temperature field is 0.015625 °C (1/64 °C).

For examples, a Temperature field value of:

- 0x0040 represents +1 °C,
- 0xFFC0 represents -1 °C,
- 0x0001 represents +0.015625 °C, and
- 0xFFFF represents -0.015625 °C.

## Digitizer Context Packet Class

This Packet Class is a type of IF Context Packet Class. The packet information conveys changes in the configuration and status of the RTSA7500's IF digitizer.

Table 15: Digitizer Context Packet Class Structure

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Pkt Type 0 1 0 0				C	R	T S M	TSI	TSF	Pkt Count								Pkt Size															
Stream Identifier (1 word)																																
Timestamp - Integer Seconds (1 word)																																
Timestamp - Integer Picoseconds (2 words)																																
Context Indicator Field (1 word)																																
Context Section (Variable Size)																																

14. **Pkt Type** shall be set to **0100** to indicate this is context packet.
15. **C** shall be set to **0** to indicate there is no Class Identifier in the packet.
16. **R** shall be set to **00**, because they are reserved bits.
17. **TSM** shall be set to **0**, indicating that context packet timestamps are precise.
18. **TSI** field shall be set to **01**, indicating that integer (seconds) part of the timestamps are in UTC.
19. **TSF** field shall be set to **10**, indicating that the fractional part of the timestamp measures real time picosecond resolution.
20. **Pkt Count** shall start at 0000 and increment once for each context packet, until reaching 1111 (or 15), where it shall rollover to 0000 on the next count.
21. **Pkt Size** indicates the size of the entire context packet, including all headers, the context indicator field and context sections.
22. **Stream Identifier** shall be the 32-bit word, **0x90000002**.
23. **Timestamp - Integer Seconds** shall be in UTC format and will represent the number of seconds occurred since Midnight, January 1, 1970 GMT.

24. **Timestamp - Integer Picoseconds** shall count the number of picoseconds past since the last increment of the Timestamp seconds field. See the Picosecond Timestamp Words Format section for the format.
25. The **Context Indicator Field** shall follow the format indicated in [Table 16](#).

Table 16: Digitizer Context Indicator Field Bit Positions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
I		B			O		R																								

26. The **Digitizer Context Fields** section shall contain a context field for every field that is indicated to be present in the Context Indicator Field. The fields shall be ordered in the identical order of their occurrence in the Context Indicator Field. See [Table 17](#) for the definition and associated value of each field.

Table 17: Digitizer Context Field Values

Bit Name	Context Field	# of Words in Field	Period of Validity
I	Context Field Change Indicator	0	N/A
B	Bandwidth	2	Persistent
O	RF Frequency Offset	2	Persistent
R	Reference Level	1	Persistent

### Context Field Change Indicator

The Context Field Change Indicator is used to indicate when some context value of the system has changed. One or more of the other bits in the indicator field will be also set, indicating which values have been changed and have their updated values in the context fields that follow. It is possible that a context packet may be sent where the Context Field Change Indicator is set to 0, indicating that no change has occurred.

### Bandwidth

The bandwidth is used to indicate that the amount of spectrum that is currently viewable due to decimation settings that have been enabled.

The Bandwidth field shall use the 64-bit, two's-complement format as shown in [Table 18](#). This field has an integer and a fractional part, with the radix point to the right of bit 20 in the second 32-bit word. This gives the RF Reference Frequency a range of  $\pm 8.79\text{THz}$  with a resolution of  $0.95\mu\text{Hz}$ .

Table 18: Bandwidth Word Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Integer Bandwidth (43..12), Hz																															
Integer Bandwidth (11..0), Hz																Fractional Bandwidth (19..0)															

### Reference Level

The Reference Level indicator provides a power level reference so that the magnitude of the received data can be calculated by a user. The reference level provided in the context packet is adjusted according to the RFE's gain setting. However, the reference levels must also be adjusted accordingly relative to the antenna (the Reference Point) and to any other conditions.

The absolute power level P (in dBm) is then computed using the following formula:

$$P = R + 20 * \log(IQ_{measured})$$

with

$$IQ_{measured} = \sqrt{(I_{fft}^2 + Q_{fft}^2)}$$

where:

R = the reference level provided in the VRT context packet, dBm

$IQ_{measured}$  = as shown in the formula above. The  $IQ_{measured}$  formula, however, is a simplified example as it doesn't include any corrections, such as IQ imbalance, DC offset or windowing

$I_{fft}$  = the real component of the FFT (Fast Fourier Transform) computation applied on the VRT I data, which is normalized by dividing each Q by  $2^{bit\_size - 1}$

$Q_{fft}$  = the imaginary component of the FFT computation applied on the VRT Q data (when used), which is normalized by dividing each Q by  $2^{bit\_size - 1}$

The Reference Level field shall use the 32-bit format shown in Table 19 with the upper 16 bits reserved and shall be set to zero. The Reference Level field value shall be expressed in signed two's-complement format in the lower 16 bits of this field. This field has an integer and a fractional part, with the radix point to the right of bit 7.

Table 19: Reference Level Field Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																Integer Ref. Level						Frac. Ref. Level									

The value of the Reference Level field has a range of nearly  $\pm 256$ dBm with a resolution of 1/128dBm (0.0078125dBm).

For examples, a Reference Level field value of:

- 0x0080 represents a reference level of +1dBm,
- 0xFF80 represents -1dBm,
- 0x0001 represents +0.0078125dBm, and
- 0xFFFF represents -0.0078125dBm.

## RF Frequency Offset

The RF Frequency Offset indicator specifies the amount of frequency in Hz the received data has been shifted.

The RF Frequency Offset field shall use the 64-bit, two's-complement format as shown in Table 20. This field has an integer and a fractional part, with the radix point to the right of bit 20 in the second 32-bit word. This gives the RF Reference Frequency a range of  $\pm 8.79$ THz with a resolution of 0.95 $\mu$ Hz.

Table 20: RF Frequency Offset Word Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Integer RF Reference Value (43..12), Hz																															
Integer RF Ref. Value (11..0), Hz																Fractional RF Reference Value(19..0)															

## Extension Context Packet Class

This Packet Class conveys metadata concerning IF Data Packet Class that cannot be communicated in the IF Context Packet Class. See Table 21 for the organization of this context packet class.

Table 21: Extension Context Packet Class Structure

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Pkt Type 0 1 0 1				C	R	T S M	TSI	TSF	Pkt Count				Pkt Size																		
Stream Identifier (1 word)																															
Timestamp - Integer Seconds (1 word)																															
Timestamp - Integer Picoseconds (2 words)																															
Context Indicator Field (1 word)																															
Context Fields (Variable Size)																															

27. **Pkt Type** shall be set to **0101** to indicate this is context packet.
28. **C** shall be set to **0** to indicate there is no Class Identifier in the packet.
29. **R** shall be set to **00**, because they are reserved bits.
30. **TSM** shall be set to **0**, indicating that context packet timestamps are precise.
31. **TSI** field shall be set to **01**, indicating that integer (seconds) part of the timestamps are in UTC.
32. **TSF** field shall be set to **10**, indicating that the fractional part of the timestamp measures in real time picosecond resolution.
33. **Pkt Count** shall start at 0000 and increment once for each context packet, until reaching 1111, where it shall rollover to 0000 on the next count.
34. **Pkt Size** indicates the total number of 32-bit words in the entire context packet, including all headers, the context indicator field and context sections.
35. **Stream Identifier** shall be the 32-bit word, **0x90000004**
36. **Timestamp - Integer Seconds** shall be in UTC format and will represent the number of seconds occurred since Midnight, January 1, 1970, GMT.
37. **Timestamp - Integer Picoseconds** shall count the number of picoseconds past since the last increment of the Timestamp seconds field. See the Picosecond Timestamp Words Format section for the format.
38. The **Context Indicator Field** shall follow the format indicated in [Table 22](#).

Table 22: Extension Context Indicator Field Positions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
I																										IQ	Sc	St	Sw		

39. The **Context Fields** section shall contain a context field for every field that is indicated to be present in the Context Indicator Field. The fields shall be ordered in the identical order of their occurrence in the Context Indicator Field. See [Table 23](#) for the definition and associated value of each field.

Table 23: Receiver Context Field Definition and Values

Bit Name	Bit Position	Context Field	# of Words in Field	Period of Validity
I	31	Context Field Change Indicator	0	N/A
IQ	3	IQ Swapped Indicator	0	Persistent
Sc	2	N/A	N/A	N/A
St	1	New Stream Start ID	1	Persistent
Sw	0	New Sweep Start ID	1	Persistent

## Context Field Change Indicator

The Context Field Change Indicator is used to indicate when some context value of the system has changed. One or more of the bits in the indicator field will then be set, indicating which values have been changed and have their updated values in the context field(s) that follow. It is possible that a context packet may be sent where the Context Field Change Indicator is set to 0, indicating that no change has occurred.

## IQ Swapped Indicator

The IQ Swapped Indicator is used to indicate whether the two ADC data channels has been swapped due to the mixing of a high-side or low-side LO injection at a given center frequency. When the value is 1, the channels are swapped and 0 if not. This swapping is necessary to maintain the data output format to always be {I,Q} such that the spectral inversion is not required at the user-end during data processing.

This information, however, matters only when operating in the ZIF mode. The ZIF mode is a direct conversion receiver architecture that typically creates some artifacts, mainly due to IQ gain and phase imbalances. The artifacts are compensated by using a specific correction algorithm, which incorporates both time- and frequency-domain corrections.

*Further information on the algorithm and its usage will be provided in a future release. Contact BNC's Support for more information if necessary.*

## New Stream Start ID

The New Stream Start ID indicator indicates a new stream capture has started, any packets following this Context Packet belong to this new stream capture.

The value of the New Stream Start ID field shall use the 32-bit unsigned integer format shown in [Table 24](#).

Table 24: New Stream Start ID Field Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
New Stream Start ID																															

## New Sweep Start ID

The New Sweep Start ID indicator indicates a new sweep has started, any packets following this Context Packet belong to this new sweep.

The value of the New Sweep Start ID field shall use the 32-bit unsigned integer format shown in [Table 25](#).

Table 25: New Sweep Start ID Field Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
New Sweep Start ID																															

## IF Data Packet Class

The IF Data Packet Class conveys digitized IF Data from the digitizer to devices external to the RTSA7500. The payload data and its output format is dependent on the RFE modes of operation (:INPut:MODE or :SWEep:ENTRy:MODE). In addition to [Table 2](#) (page 18), the following [Table 26](#) describes the output data width and packing method for the different data type in order comply with VRT's 32-bit word output format:

Table 26: Output Data Width and Packing Method for Different Data Formats

Original Data Format	Binary Format Per Data Component	Signed Extension	Per 32-bit Word Packing Method
{l14Q14}	Signed 2-complement	{l16Q16}	{l16Q16}
{l14}	Signed 2-complement	{l16}	{l16l216}
{l24}	Signed 2-complement	{l32}	{l32}

The different Stream Identifier values will be used to indicate these different formats.

The order of the fields in an IF Data packet is organized as shown in Table 27. Packets is transmitted in big-endian byte order.

Table 27: IF Data Class Field Values

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Pkt Type		C	T	-	TSI		TSF		Pkt Count			Pkt Size																			
Stream Identifier (1 word)																															
Timestamp - Integer Seconds (1 word)																															
Timestamp - Integer Picoseconds (2 words)																															
Data Payload (Variable Size)																															
Trailer (1 word)																															

- 40. **Pkt Type** shall be **0001**, indicating that a stream identifier is present.
- 41. **C** shall be set to **0**, indicating that there is no class identifier present.
- 42. **T** shall be set to **1**, indicating there is a trailer word in the packet.
- 43. **TSI** field shall be set to **01**, indicating that integer (seconds) part of the timestamps are in UTC.
- 44. **TSF** field shall be set to **10**, indicating that the fractional part of the timestamp measures in real time picosecond resolution.
- 45. **Pkt Count** shall start at 0000, and be incremented once for each IF Data packet that is received, until reaching 1111, when it then wraps back to 0000 on the next count.
- 46. **Pkt Size** shall be the number of 32-bit words that are present in the packet, including all headers, data payload and trailer if included.
- 47. **Stream Identifier** shall have the values as shown in the following Table 28.

Table 28: Stream Identifier Values for Different Data Output Formats

Data Output Format	Stream Identifier
{l14Q14}	0x90000003
{l14}	0x90000005
{l24}	0x90000006

- 48. **Timestamp - Integer Seconds** shall be in UTC format and will represent the number of seconds occurred since Midnight, January 1st, 1970, GMT.
- 49. **Timestamp - Integer Picoseconds** shall count the number of picoseconds past since the last increment of the Timestamp seconds field. See Table 29.
- 50. **Data Payload** shall contain the IF data from the RTSA7500, arranged in the format indicated in Table 30 to Table 32.
- 51. **Trailer** shall be included and be arranged in the format described in Table 33.

## Picosecond Timestamp Words Format

The two 32-bit words timestamp allotted for picoseconds are arranged as below.

Table 29: 64-bit or Two Words Picosecond Timestamp Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Timestamp – picoseconds, Word 1 (63..32)																																	
																Timestamp – picoseconds, Word 2 (31..0)																	

## Data Payload Format

The data payload of an IF Data packet contains a contiguous sequence of the Data Samples from an IF Data Sample stream. The number of words in the data payload is variable from packet to packet, and can be determined at the receiving end of the link from the Packet Size by subtracting the number of words dedicated to the header, trailer, and other additional fields. The presence or absence of these fields can be determined entirely from information in the header.

52. The maximum number of data payload 32-bit words shall be  $2^{16}-16$  and must be a multiple of 16. Limitation due to embedded data transferring engine.
53. The data payload shall consist of an integer number of contiguous 32-bit words.
54. IF Data Packets convey either the time domain in-phase (I or real) and/or quadrature (Q or imaginary) components forming the Complex Cartesian samples.

### {I<sub>14</sub>Q<sub>14</sub>} Data Payload Format

55. Each I or Q data is a signed two's-complement 14-bit data with signed extended into 16-bit. Thus, each component is an integer ranging from -8192 to +8191 (or  $\pm 2^{13}$ ).
56. The I-component is in the upper 16-bit of each data word followed by the Q-component in the lower 16-bit, as seen in Table 30.

Table 30: {I<sub>14</sub>Q<sub>14</sub>} Data Payload Arrangement with Upper 2-bit of Each Item Signed Extended to {I<sub>16</sub>Q<sub>16</sub>}

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0bxx		Item 1 (Sample 1 I <sub>14</sub> )														0bxx		Item 2 (Sample 1 Q <sub>14</sub> )													
0bxx		Item 3 (Sample 2 I <sub>14</sub> )														0bxx		Item 4 (Sample 2 Q <sub>14</sub> )													
0bxx		Item 5 (Sample 3 I <sub>14</sub> )														0bxx		Item 6 (Sample 3 Q <sub>14</sub> )													
⋮		⋮														⋮		⋮													

Example conversion, given the big-endian bytes 0x0018FFFE received:

- Split into two data items ( $i = 0x0018$ ,  $q = 0xFFFE$ )
- Parse signed two's complement ( $i = 24$ ,  $q = -2$ )
- Compute fractional value if needed:  $i/2^{13}$  and  $q/2^{13}$

### {I<sub>14</sub>} Data Payload Format

57. Each I data is a signed two's-complement 14-bit sample with signed extended into 16-bit. Thus, each component is an integer ranging from -8192 to +8191 (or  $\pm 2^{13}$ ).
58. The first I sample is in the upper 16-bit of each data word follows by the second I sample in the lower 16-bit, as seen in Table 31.

Table 31:  $\{I_{14}\}$  Data Payload Arrangement with Upper 2-bit Signed Extended to  $\{I_{16}\}$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0bxx		Item 1 (Sample 1 $I_{14}$ )														0bxx		Item 2 (Sample 2 $I_{14}$ )													
0bxx		Item 3 (Sample 3 $I_{14}$ )														0bxx		Item 4 (Sample 4 $I_{14}$ )													
0bxx		Item 5 (Sample 5 $I_{14}$ )														0bxx		Item 6 (Sample 6 $I_{14}$ )													
⋮		⋮														⋮		⋮													

Same conversion example as  $\{I_{14}Q_{14}\}$ .

### $\{I_{24}\}$ Data Payload Format

59. Each data word is one I-component as seen in Table 32.
60. Each I data is a signed two's-complement 24-bit sample with signed extended into 32-bit. Thus, each component is an integer ranging from -8388608 to +8388607 (or  $\pm 2^{23}$ ).

Table 32:  $\{I_{24}\}$  Data Payload Arrangement with Upper 8-bit Signed Extended to  $\{I_{32}\}$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0bxxxxxxxx								Item 1 (Sample 1 $I_{24}$ )																							
0bxxxxxxxx								Item 2 (Sample 2 $I_{24}$ )																							
0bxxxxxxxx								Item 3 (Sample 3 $I_{24}$ )																							
⋮								⋮																							

Examples conversion:

- Given the big-endian bytes 0x0018FFFE, then  $I_{24} = 0x18FFFE$ .
- Given the big-endian bytes 0xFF800034, then  $I_{24} = 0x800034$  (or -8388556).
- Compute fractional value if needed:  $i/2^{23}$ .

### Trailer Word Format

Table 33: Trailer Word Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Enables												State and Event Indicators											E	Associated Context Packet Count							
DV	RL					SI	OR	SL							DV	RL															

State and Event Indicators and the associated Enable bits shall be positions as indicated in Table 34.

61. For each Indicator bit in the State and Event Indicators field, there is a corresponding Enable bit at the same position in the Enables field.
62. When an Enable bit is set to 1, the corresponding indicator shall function as shown in Table 34. Otherwise, the corresponding indicator shall not be considered valid.
63. Unused bits in the Enables field and the Indicators field shall be set to 0.
64. The E field shall be set to 0 to specify the Associated Context Packet Count field as undefined.
65. The Associated Context Packet Count field is unused and shall be set to 0.

Table 34: Trailer Indicator and Enable Bits

Enable Bit Position	Indicator Bit Position	Indicator Name
30	18	Valid Data Indicator
29	17	Reference Lock Indicator
26	14	Spectral Inversion Indicator
25	13	Over-range Indicator
24	12	Sample Loss Indicator

66. The **Valid Data Indicator**, when set to 1, shall indicate that the data in the packet is valid. When set to zero, it shall indicate that some condition exists that may invalidate the data.
67. The **Reference Lock Indicator**, when set to 1, shall indicate all PLLs in the system are locked and stable, and when set to 0, shall indicate one or all of the PLLs is not locked or unstable. It is very crucial to check this indicator bit.
68. The **Spectral Inversion Indicator**, when set to 1, shall indicate that the signal conveyed in the data payload has an inverted spectrum with respect to the spectrum of the signal at the system Reference Point. When processing the data payload, for plotting purpose for instance, follow the suggested solution in [Table 35](#) to properly display the spectrum.

**Important Note:** When using :OUTput:IQ:MODE CONNector with :INPut:MODE SH or SHN, the spectral inversion indicator is available through the GPIO port. Contact BNC's Support for further details (or see "Synchronized Sweep with IQout" AppNote for important information).

69. The **Over-range Indicator** shall be set to 1 if any data value in the packet has reached full scale at the input of the digitizer.
70. The **Sample Loss Indicator**, when set to 1, shall indicate that data overflow occurs **after** the current captured VRT packet, **not within** the packet. In other words, the samples of the immediate packet following the current packet with the sample loss indicator bit high are not continuous from those of the current packet.

[Table 35](#) lists the conditions in which an indicator would signal an abnormal state and the suggested resolutions.

Table 35: Conditions Causing Abnormal Indicator State and Suggested Resolution

Indicator Name	Abnormal State	Conditions	Suggested Resolution
<b>Valid Data</b>	0	1) One or more PLLs failed to lock.  2) In HDR mode, the NB ADC's filter has not settled.	1) Try to reset the frequency or restart the RTSA 7500. If the condition persists, contact BNC's Support.  2) Discard the data packet and re-acquire the data. This condition is unlikely as the settle time is within hundred of nanoseconds.
<b>Reference Lock</b>	0	One or more PLLs failed to lock.	Same as 1) above
<b>Spectral Inversion</b>	1	Spectral inversion occurs when the frequency of the local oscillator exceeds that of the RF input signal being	Either swap each {I,Q} data point when both {I,Q} components are available or invert the output data bins of the computed spectral

Indicator Name	Abnormal State	Conditions	Suggested Resolution
		processed. At some signal frequency ranges input to the RTSA7500, the IF output spectrum is inverted. <a href="#">Figure 10</a> illustrates an example.	power. The latter suggestion is recommended since SH and SHN mode without the frequency shift particularly have {} only data.
<b>Over-range</b>	1	The over-range threshold is the absolute full-scale of I or Q data. For WB ADC, the over-range threshold is at $V_{peak} = 1.0$ V; and for NB ADC, $V_{peak} = 1.6$ V.	<ul style="list-style-type: none"> <li>- Enable the :ATTenuator if it is not yet on.</li> <li>- If :ATTenuator is already on, reduce the input level or the gain settings.</li> </ul>
<b>Sample Loss</b>	1	This condition occurs only in Stream mode when the internal buffer is full.	Use a decimation value such that the transfer rate matches that of the capture rate.

Figure 10: An Example Illustrating Uninvolved and Involved Spectrums

## SCPI Command Set

This section is a SCPI reference guide for controlling the BNC RTSA7500 Real Time Spectrum Analyzer. The RTSA7500 supports the Standard Commands for Programmable Instruments (SCPI) standard version 1999.0 as described in the following sections. SCPI lends itself to a command line interface and scripting, is supported by the major instrument vendors and provides a high level of familiarity for instrument users.

**Note:** BNC's version of SCPI does not provide commands for network connection. The RTSA7500 receives SCPI commands and sends query responds over port 37001. See Appendix A: Connecting to RTSA 7500 for more details.

### SCPI Language Overview

In the early 1990s, a group of instrument manufacturers developed Standard Commands for Programmable Instrumentation (SCPI) for controlling programmable instruments via a communication link, such as RS232, USB, LAN, etc. SCPI specifies the command structure and syntax using ASCII characters to provide some basic standardization and consistency to the control commands. SCPI commands, hence, lend themselves to communications with equipments via command line interface, scripting and/or programming languages such as C/C++, MATLAB®, Python, etc.

The SCPI language is based on a hierarchical or tree structure as illustrated in [Figure 11](#) an example command set. The top level of the tree is the root node, which is followed by one or more lower-level nodes.

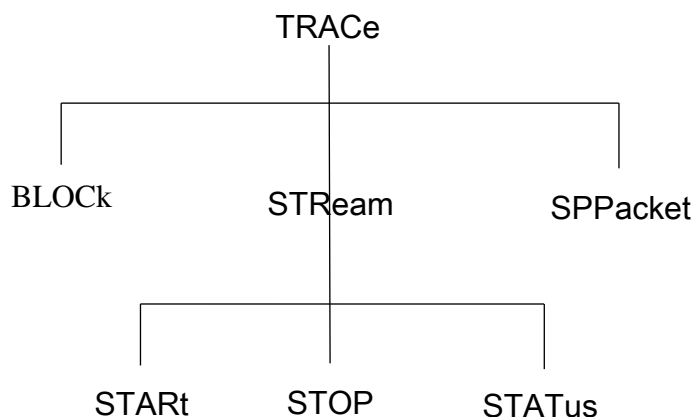

Figure 11: SCPI Language Hierarchical or Tree Structure Example

SCPI defines a measurement function block that is directly applicable to the BNC RTSA 7500. The measurement function converts a physical signal into an internal data form that is available for formatting into bus data. It may perform the additional tasks of signal conditioning and post-conversion calculation. The measurement function box is subdivided into three distinct parts: INPut, SENSE, and CALCulate as seen in Figure 12.

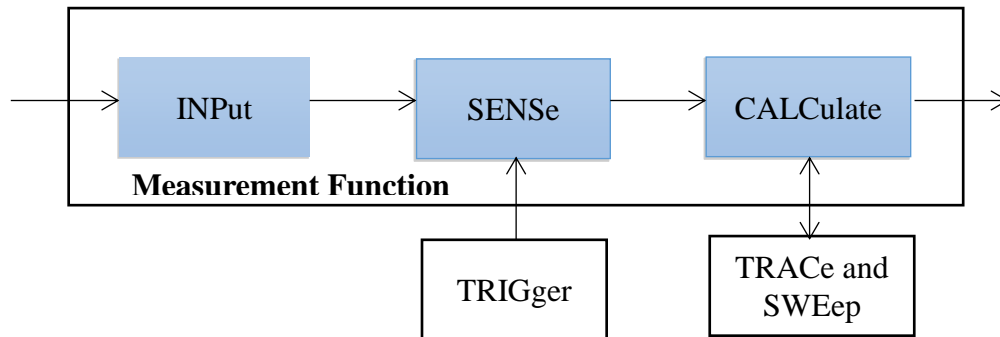

Figure 12: SCPI Measurement Function Block

Refer to the Appendix C: SCPI Command Syntax section for the general SCPI command syntax format and usage details.

## IEEE Mandated SCPI Commands

These commands control and query the communication event/error and status registers as defined in the Appendix D: SCPI Status and Event Registers section. They are mandated by the IEEE.

---

**Caution:** The mandated IEEE SCPI commands are not affected by \*RST command.

---

### \*CLS

The Clear Status (CLS) command clears the Status Byte register (STB), the standard Event Status register (ESR), the standard Questionable status register, the standard Operation Status register, and the error/event queue.

<b>Syntax</b>	*CLS
<b>Parameter/Response</b>	None

### \*ESE/\*ESE?

\*ESE command enables bits in the ESE register. The decimal integer value entered is the binary equivalent of the desired 8-bit mask. Bits enabled in ESE and set in ESR register will result in the Standard Event Status Summary bit (bit 5) in the STB register being set. This then allows the reading of ESR by using the \*ESR? query command to determine the cause.

\*ESE? query returns the decimal sum of the enabled bits in the ESE register. The decimal sum is the binary equivalent of the 8-bit mask.

See [Figure 13](#) for the ESE/ESR register bits mapping.

<b>Syntax</b>	*ESE <integer> *ESE?
<b>Parameter/Response</b>	<integer>
<b>Allowable Values</b>	0 - 255

## \*ESR?

Query the standard Event Status Register (ESR), which returns the decimal sum of the bits set in the ESR. The decimal sum is the binary equivalent of the 8-bit mask. Any specific bit in the ESR will only appear set if and only if its event has occurred and the corresponding bit in the ESE is also enabled.

See [Figure 13](#) for the ESR register bits mapping.

---

**Caution:** This is a destructive read. Once queried, the register is cleared.

---

<b>Syntax</b>	*ESR?
<b>Parameter</b>	None
<b>Response</b>	<integer>
<b>Description</b>	Refer to the <a href="#">Appendix D: SCPI Status and Event Registers</a> section for the ESR register bit definition

## \*IDN?

Returns the RTSA7500's identification information string.

---

**Note:** The model string returned will not include the options (ie. ELO, HIF, WBIQ, etc). To find out which options a model has, use :SYSTem:OPTions? command.

---

<b>Syntax</b>	*IDN?
<b>Parameter</b>	None
<b>Response</b>	"<Manufacturer>,<Model>,<Serial number>,<Firmware version>"
<b>Data Type</b>	string

## \*OPC/\*OPC?

\*OPC (Operation Complete) command sets to confirm bit 0 in the ESR to 1 when all commands received before \*OPC or \*OPC? have been completed.

\*OPC? returns the ASCII character 1 in the Standard Event register indicating completion of all pending operations. The query also stops any new commands from being processed until the current processing is complete.

<b>Syntax</b>	*OPC
---------------	------

	*OPC?
<b>Parameter</b>	None
<b>Query Response</b>	1

## \*RST

Resets the RTSA7500 to its default settings. This includes stopping any running capture mode and trigger mode, and also performs :SYSTem:FLUSh.

\*RST does not affect the registers or queues associated with the IEEE mandated commands. Each non-IEEE mandated command description in this reference shows the \*RST value when affected.

<b>Syntax</b>	*RST
<b>Parameter/Response</b>	None

## \*SRE/\*SRE?

The \*SRE (Service Request Enable) command enables bits in the SRE register. The decimal integer value entered is the binary equivalent of the desired 8-bit mask to be enabled. Bits enabled in this register allow accessing the equivalent bits status in the STB register.

\*SRE? query returns the decimal sum of the enabled bits in the SRE register. The decimal sum is the binary equivalent of the 8-bit mask.

See [Figure 13](#) for the SRE/STB register bits mapping.

<b>Syntax</b>	*SRE <integer> *SRE?
<b>Parameter/Response</b>	<integer>

## \*STB?

\*STB? (Status Byte) query returns the decimal sum of the bits set in the STB register without erasing its content. The decimal sum is the binary equivalent of the 8-bit mask. Any specific bit in the STB will only appear set if and only if its event has occurred and the corresponding bit in the SRE is also enabled.

See [Figure 13](#) for the ESE/ESR register bits mapping and the Status Byte Register (SBR) section of the [Appendix D](#) for the bits definition.

<b>Syntax</b>	*STB?
<b>Parameter</b>	None
<b>Response</b>	<integer>

## \*TST?

\*TST? (self-test) query initiates the device's internal self-test and returns one of the following results:

- 0 - all tests passed.

- 1 - one or more tests failed.

**Syntax** \*TST?  
**Parameter** None  
**Response** 0 | 1  
 Output Data Type Integer

### \*WAI

\*WAI (Wait-to-Continue) command suspends the execution of any further commands or queries until all operations for pending commands are completed.

**Syntax** \*WAI  
**Parameter/Response** None

## SYSTEM Commands

These commands control and query the communication event and status registers as defined in the Appendix D: SCPI Status and Event Registers. They are the minimal :SYSTEM sets required in all SCPI instruments.

### :SYSTEM:ABORt

This command will cause the RTSA7500 to stop the data capturing, whether in the manual trace block capture, triggering or sweeping mode. The RTSA7500 will be put into the manual mode; in other words, process such as streaming, trigger and sweep will be stopped. The capturing process does not wait until the end of a packet to stop, it will stop immediately upon receiving the command.

**Syntax** :SYSTEM:ABORt  
**Parameter/Response** None  
 \*RST State N/A  
 Example :SYST:ABORT

### :SYSTEM:CAPability?

This query returns the RTSA7500's capabilities including firmware versions and installed hardware options. The output is a list of SCPI-defined basic functionality of the RTSA7500 and the additional capabilities it has in parallel (a&b) and singularly (a|b).

Further information will be provided in a future revision of this document.

**Syntax** :SYSTEM:CAPability?  
**Parameter** None  
**Response** <character>  
 Example :SYST:CAP?

### :SYSTEM:CAPTure:MODE?

This command returns what the current RTSA 7500 data capture mode is (i.e. sweeping, streaming or block mode).

When stream or sweep mode is stopped, block mode will resume.

**Syntax** :SYSTem:CAPTure:MODE?  
**Parameter** None  
**Response** BLOCK | STREAMING | SWEEPING  
Output Data Type Character  
**\*RST State** BLOCK  
**Example** :SYST:CAPTURE:MODE?

## :SYSTem:COMMunicate:LAN:APPLY

This command will apply the changes to the LAN settings and the embedded system will automatically reconfigure the Ethernet to put in effect the new LAN setting. Once the LAN settings are applied, they are not affected by power-on, :STATus:PRESET, or \*RST.

**Caution:** When changing from DHCP to STATIC mode, this command should to be sent only when all the required LAN settings are set using the appropriate :SYSTem:COMMunicate:LAN commands.

**Syntax** :SYSTem:COMMunicate:LAN:APPLY  
**Parameter/Response** None  
**\*RST State** N/A  
**Examples** :SYST:COMM:LAN:APPLY

## :SYSTem:COMMunicate:LAN:CONFigure

The set command will store the new LAN configuration type to be applied to the RTSA 7500. This command does not take effect until :SYSTem:COMMunicate:LAN:APPLY is sent (please refer to the Caution note of the :APPLY command). Once the option is applied, it is not affected by power-on, :STATus:PRESET, or \*RST.

The query will return the option set or that of the actual current configuration if one is not set. The CURRENT query will return what is currently and actually used by the RSTA 7500's LAN interface.

**Note:** \*RST command cannot be used to set the box to its manufacturing default state of DHCP. To set the box back to DHCP from a working STATIC mode, use this command or the web-browser as mentioned in the RTSA 7500 User's Guide.

**Syntax** SYSTem:COMMunicate:LAN:CONFigure DHCP | STATIC  
SYSTem:COMMunicate:LAN:CONFigure? [CURRENT]  
**Parameter** Set: DHCP | STATIC  
Query: [CURRENT]  
**Response** DHCP | STATIC  
I/O Data Type Character  
**\*RST State** N/A  
**Examples** :SYST:COMM:LAN:CONF DHCP

:SYST:COMM:LAN:CONF? CURRENT

## **:SYSTem:COMMunicate:LAN:DNS**

The set command will store the new LAN DNS server address(es) to be applied to the RTSA 7500. This command does not take effect until :SYSTem:COMMunicate:LAN:APPLY is sent (please refer to the Caution note of the :APPLY command). Once the setting is applied, it is not affected by power-on, :STATus:PRESET, or \*RST.

The query will return the LAN DNS address(es) set or that of the actual current configuration if one is not issued. The CURRENT query will return what is currently and actually used by the RTSA 7500's LAN interface.

**Syntax** SYSTem:COMMunicate:LAN:DNS <main DNS>[,alternative DNS]  
SYSTem:COMMunicate:LAN:DNS? [CURRENT]

**Parameter** Set: D.D.D.D[,D.D.D.D] where D = 0 – 255  
Query: [CURRENT]

**Response** D.D.D.D[,D.D.D.D]

I/O Data Type String

\*RST State N/A

**Examples** SYSTEM:COMMUNICATE:LAN:DNS 208.67.110.0  
SYST:COMM:LAN:DNS 208.67.110.0,208.67.100.10  
SYSTEM:COMMUNICATE:LAN:DNS?  
SYST:COMM:LAN:DNS? CURRENT

## **:SYSTem:COMMunicate:LAN:GATEway**

The set command will store the new LAN gateway to be applied to the RTSA 7500. This command does not take effect until :SYSTem:COMMunicate:LAN:APPLY is sent (please refer to the Caution note of the :APPLY command). Once the setting is applied, it is not affected by power-on, :STATus:PRESET, or \*RST.

The query will return the gateway address set or that of the actual current configuration if one is not issued. The CURRENT query will return what is currently and actually used by the RTSA 7500's LAN interface.

**Syntax** SYSTem:COMMunicate:LAN:GATEway <IPv4 address>  
SYSTem:COMMunicate:LAN:GATEway? [CURRENT]

**Parameter** Set: D.D.D.D where D = 0 – 255  
Query: [CURRENT]

**Response** D.D.D.D

I/O Data Type String

\*RST State N/A

**Examples** SYST:COMM:LAN:GATEWAY 102.101.0.13  
SYSTEM:COMMUNICATE:LAN:GATEWAY?  
SYST:COMM:LAN:GATE? CURRENT

## **:SYSTem:COMMunicate:LAN:IP**

The set command will store the new LAN IP to be applied to the RTSA 7500. This command does not take effect until :SYSTem:COMMunicate:LAN:APPLY is sent (please

refer to the Caution note of the :APPLY command). Once the setting is applied, it is not affected by power-on, :STATUS:PRESET, or \*RST.

The query will return the IP address set or that of the actual current configuration if one is not issued. The CURRENT query will return what is currently and actually used by the RTSA 7500's LAN interface.

<b>Syntax</b>	SYSTem:COMMunicate:LAN:IP <IPv4 address> SYSTem:COMMunicate:LAN:IP? [CURRENT]
<b>Parameter</b>	Set: D.D.D.D where D = 0 – 255 Query: [CURRENT]
<b>Response</b>	D.D.D.D
<b>I/O Data Type</b>	String
<b>*RST State</b>	N/A
<b>Examples</b>	SYST:COMM:LAN:IP 101.125.1.16 SYSTEM:COMM:LAN:IP? SYST:COMM:LAN:IP? CURRENT

## **:SYSTem:COMMunicate:LAN:NETMask**

The set command will store the new LAN netmask address to be applied to the RTSA 7500. This command does not take effect until :SYSTem:COMMunicate:LAN:APPLY is sent (please refer to the Caution note of the :APPLY command). Once the setting is applied, it is not affected by power-on, :STATUS:PRESET, or \*RST.

The query will return the maskaddress set or that of the actual current configuration if one is not issued. The CURRENT query will return what is currently and actually used by the RTSA 7500's LAN interface.

<b>Syntax</b>	SYSTem:COMMunicate:LAN:NETMask <address> SYSTem:COMMunicate:LAN:NETMask? [CURRENT]
<b>Parameter</b>	Set: D.D.D.D where D = 0 – 255 Query: [CURRENT]
<b>Response</b>	D.D.D.D
<b>I/O Data Type</b>	String
<b>*RST State</b>	N/A
<b>Examples</b>	SYST:COMM:LAN:NETMASK 255.255.255.0 SYSTEM:COMMUNICATE:LAN:NETM? SYST:COMM:LAN:NETM? CURRENT

## **:SYSTem:ERRor[:NEXT]?**

This query returns the oldest uncleared error code and message from the SCPI error/event queue. When there are no error messages, the query returns 0,"No error". \*RST does not affect the error queue.

**Note:** It is recommended to do this query command after each non-query command is sent to ensure that the non-query command is executed without error. Since each error message is queued into a buffer, if multiple commands have been sent follow by only one :SYSTem:ERRor[:NEXT]? command, it would be uncleared which command has resulted in which error.

---

**Syntax** :SYSTem:ERRor[:NEXT]?  
**Parameter** None  
**Response** <error code>,<description>  
 Output Data Type <integer>,<string>  
 Description Refer to the Appendix D: SCPI Status and Event Registers section  
 Example :SYST:ERR?

## :SYSTem:ERRor:ALL?

This query returns all the uncleared error codes and messages from the SCPI error/event queue. If there are no error messages, the query returns 0,"No error".

**Syntax** :SYSTem:ERRor:ALL?  
**Parameter** None  
**Response** <error code>,<description>{,<error code>,<description>}  
 Output Data Type <integer>,<string>{,<integer>,<string>}  
 Description Refer to the Appendix E: SCPI Error Codes Used section  
 Example :SYST:ERR:ALL?

## :SYSTem:FLUSH

This command clears the RTSA7500's internal data storage buffer of any data that is waiting to be sent. Thus, it is recommended that the flush command should be used when switching between different capture modes to clear up the remnants of packet within the RTSA 7500.

**Caution:** Issuing :SYSTem:FLUSH any time during streaming or sweeping mode will cause the stream or sweep capture to stop (abort) and switch automatically to block capture mode.

**Note:** Flush command only handles the RTSA 7500's internal buffer storage. The host application should ensure that the socket buffer is also cleared up of any potential data in the socket buffer. This can be done by calling the receive socket (non-blocking) until no data is returned. With Streaming or Sweeping, the start ID in a VRT extension packet marks the beginning of packets belonging to the new stream or sweep. This helps to distinct old packets from new packets.

**Syntax** :SYSTem:FLUSH  
**Parameter/Response** None  
 \*RST State N/A  
 Examples :SYST:FLUSH

## :SYSTem:LOCK:HAVE?

This query returns the current lock state of the specified task.

<b>Syntax</b>	:SYSTem:LOCK:HAVE? ACQquisition
<b>Parameter</b>	ACQquisition
Input Data Type	Character
<b>Response</b>	1   0 1 – Have the lock 0 – Does not have the lock
Output Data Type	Boolean
*RST State	N/A
Examples	:SYST:LOCK:HAVE? ACQ

## :SYSTem:LOCK:REQuest?

This query attempts to attain the lock on the RTSA7500 for a specific task, such as data acquisition. The query returns 1 when lock is successful or 0 if it fails.

Attaining a lock is equivalent to having the sole ownership for that task. This prevents multiple connected applications from doing the same task that would result in an erroneous operation or feedback from the RTSA7500. The RTSA7500's system lock ownership works in the following manner:

- The first application to connect to RTSA7500 will automatically have the lock. The next application will need to perform this query request to attain the lock.
- When there is only one application connected (or the last one remained), that application will automatically has the lock.
- The last application that requested successfully has the lock until another application attained it.

Any application that doesn't have the specific lock will not be able to perform that task.

---

**Note:** When a TCP/IP socket connection is not exited properly, that socket might continue to exist in the RTSA7500 server for a few minutes. This could affect a situation when only one application is used to connect to the RTSA7500 as reconnection by that application might not get the lock. This application would then need to request the lock.

---

<b>Syntax</b>	:SYSTem:LOCK:REQuest? ACQquisition
<b>Parameter</b>	ACQquisition
Input Data Type	Character
<b>Response</b>	1   0 1 – Successfully locked 0 – Failed to lock
Output Data Type	Boolean
*RST State	N/A
Example	:SYST:LOCK:REQ? ACQ

## :SYSTem:OPTions?

This command queries the hardware option(s) or features that a particular RTSA 7500 model supported. The response string contains comma separated 3-digit values to represent the options. See [Table 36](#) for the translated list. Examples:

- RTSA7500-2XX-ELO would have code 001 returned in the response string to indicate “external local oscillators” option;
- RTSA7500-4XX-WBIQ-ELO would have code 001,003 returned in the response string to indicate ELO and wideband IQ options.

**Syntax** :SYSTem:OPTions?  
**Parameter** None  
**Response** <xxx>{,<xxx>}  
 Output Data Type Comma separated 3-digit value (ex: 000, 001, 002)  
 \*RST State None  
 Example :SYST:OPT?

Table 36: RTSA 7500 Option Codes and the Corresponding Description

Option Code	Description	Related SCPI Command
000	No Special Option	
001	External Local Oscillator (ELO) Input <sup>1</sup>	[:SENSe]:FREQuency:LOSCillator?
002	RTSA7500-XXX-HIF Model	:INPut:MODE HIF [:SENSe]:FREQuency:IF?
003	RTSA7500-4XX-WBIQ <sup>1</sup> Model	None :OUTput:IQ:MODE is defaulted to DIGitizer
004	RTSA7500-4XX-P Model	None

<sup>1</sup> ELO and/or WBIQ are special RTSA7500 variants, not available on all RTSA7500s. Contact BNC for more details on the usage of these variants.

## :SYSTem:SYNC:MASTer

This command sets the RTSA 7500 unit to be the master or slave for a synchronization trigger system with multiple units, in which **only one unit** can be the master.

The master sends a sync-word or pulse (set through :TRIGger:TYPE or :SWEep:ENTRy:TRIGger:TYPE) via its GPIO to that of the slaves to indicate the beginning of a capture. The master RTSA 7500 itself will have an internal loop-back of the synchronization signal it sent out.

**Syntax** :SYSTem:SYNC:MASTer <Boolean>  
 :SYSTem:SYNC:MASTer?  
**Parameter** ON | OFF | 1 | 0  
 Input Data Type Integer | Character  
**Query Response** 0 | 1  
 Output Data Type Integer  
 \*RST State 0  
 Examples :SYSTem:SYNC:MASTer ON  
 :SYSTem:SYNC:MAST?

## **:SYSTem:SYNC:WAIT**

This command sets the delay time in nanoseconds that a RTSA 7500 system must wait after receiving the satisfying trigger signal and before performing data capture. The delay time should be a multiple of 8 nsec as the RTSA 7500 system runs with a 125MHz clock.

<b>Syntax</b>	:SYSTem:SYNC:WAIT <integer> :SYSTem:SYNC:WAIT?
<b>Parameter/Response</b>	<integer>
Allowable Values	0 – 4294967295 (or $2^{32}-1$ )
*RST State	0
Examples	:SYSTem:SYNC:WAIT 120 :SYSTem:SYNC:WAIT?

## **:SYSTem:VERSion?**

This query returns the SCPI version number that the instrument software complies with.

<b>Syntax</b>	:SYSTem:VERSion?
<b>Parameter</b>	None
<b>Response</b>	<NR2>
Output Data Type	String (decimal number YYYY.V)
Example	:SYST:VERS

## **:SYSTem:DATE**

This command set or queries the current date of the RTSA7500. When the date is set, the change is applied to the real time clock (RTC) of the RTSA7500 system, and the :SYSTem:TIME:SYNC field is changed to DISable automatically. The date returned is representative of the current time mode that is UTC.

This command is not affected by a power-on, factory reset, or \*RST command.

<b>Syntax</b>	:SYSTem:DATE <integer>,<integer>,<integer> :SYSTem:DATE?
<b>Parameters/Response</b>	<year>,<month>,<date>
I/O Data Type	String (comma separated integers)
<b>Allowable Values</b>	Year: YYYY - requires a four digit integer Month: 1 - 12 Date: 1 - 31
*RST State	N/A
Examples	:SYST:DATE 2012,12,2 :SYSTEM:DATE?

## **:SYSTem:TIME**

This command set or queries the current time of the RTSA7500. When the time is set, the change is applied to the RTC of the RTSA7500 system, and the :SYSTem:TIME:SYNC field is changed to DISable automatically.

The time returned is representative of the current time mode that is UTC.

This command is not affected by a power-on, factory reset, or \*RST command.

<b>Syntax</b>	:SYSTem:TIME <integer>,<integer>,<integer>[,<integer>] :SYSTem:TIME?
<b>Parameters/Response</b>	<hour>,<minute>,<second>[,<millisecond>]
<b>I/O Data Type</b>	String (comma separated integers)
<b>Allowable Values</b>	Hour: 0 - 23 Minute: 0 - 59 Second: 0 - 59 Millisecond: 0 - 999
<b>*RST State</b>	N/A
<b>Examples</b>	:SYST:TIME 10,30,15 :SYSTEM:TIME?

## :SYSTem:TIME:ADJust

This command adjusts the system time relative to its current time.

Further information will be provided in a future revision of this document.

<b>Syntax</b>	:SYSTem:TIME:ADJust <integer> [unit] :SYSTem:TIME:ADJust?
<b>Parameters</b>	<second or sub-second> [unit]
<b>Allowable Values</b>	0 - 4294967295 (or $2^{32} - 1$ )
<b>Response</b>	<integer>
<b>Default I/O unit</b>	ns
<b>*RST State</b>	0
<b>Examples</b>	:SYST:TIME:ADJUST 10 ns :SYSTEM:TIME:ADJUST?

## :SYSTem:TIME:SYNC

This command selects the time synchronization source for RTSA7500 and the query returns the source selected. Choosing NTP (Network Time Protocol) as the synchronization source will impact the system real time clock (RTC), causing it to update either at a continuous interval or one time only. When :SYSTem:DATE and/or :SYSTem:TIME commands are used to change the time, the source will automatically be changed to DISable.

\*RST does not affect this command. At factory install, the synchronization is defaulted to disabled.

<b>Syntax</b>	:SYSTem:TIME:SYNC DISable   NTP,{ONCE   CONTInuous} :SYSTem:TIME:SYNC?
<b>Parameter</b>	DISable   NTP,{ONCE   CONTInuous}
<b>Response</b>	DISabled   NTP,{ONCE   CONTInuous}
<b>I/O Data Type</b>	Character   String (comma separated characters)
<b>*RST State</b>	DISable
<b>Examples</b>	:SYST:TIME:SYNC NTP,ONCE :SYST:TIME:SYNC DISABLE

:SYSTEM:TIME:SYNC?

## **:SYSTem:TIME:SYNC:STATus?**

This command returns the current status of the time synchronization.

Further information will be provided in a future revision of this document.

<b>Syntax</b>	:SYSTem:TIME:SYNC:STATus?
<b>Parameter</b>	None
<b>Response</b>	TBD
<b>Data Type</b>	TBD
<b>Examples</b>	:SYST:TIME:SYNC:STAT?

# STATUS Commands

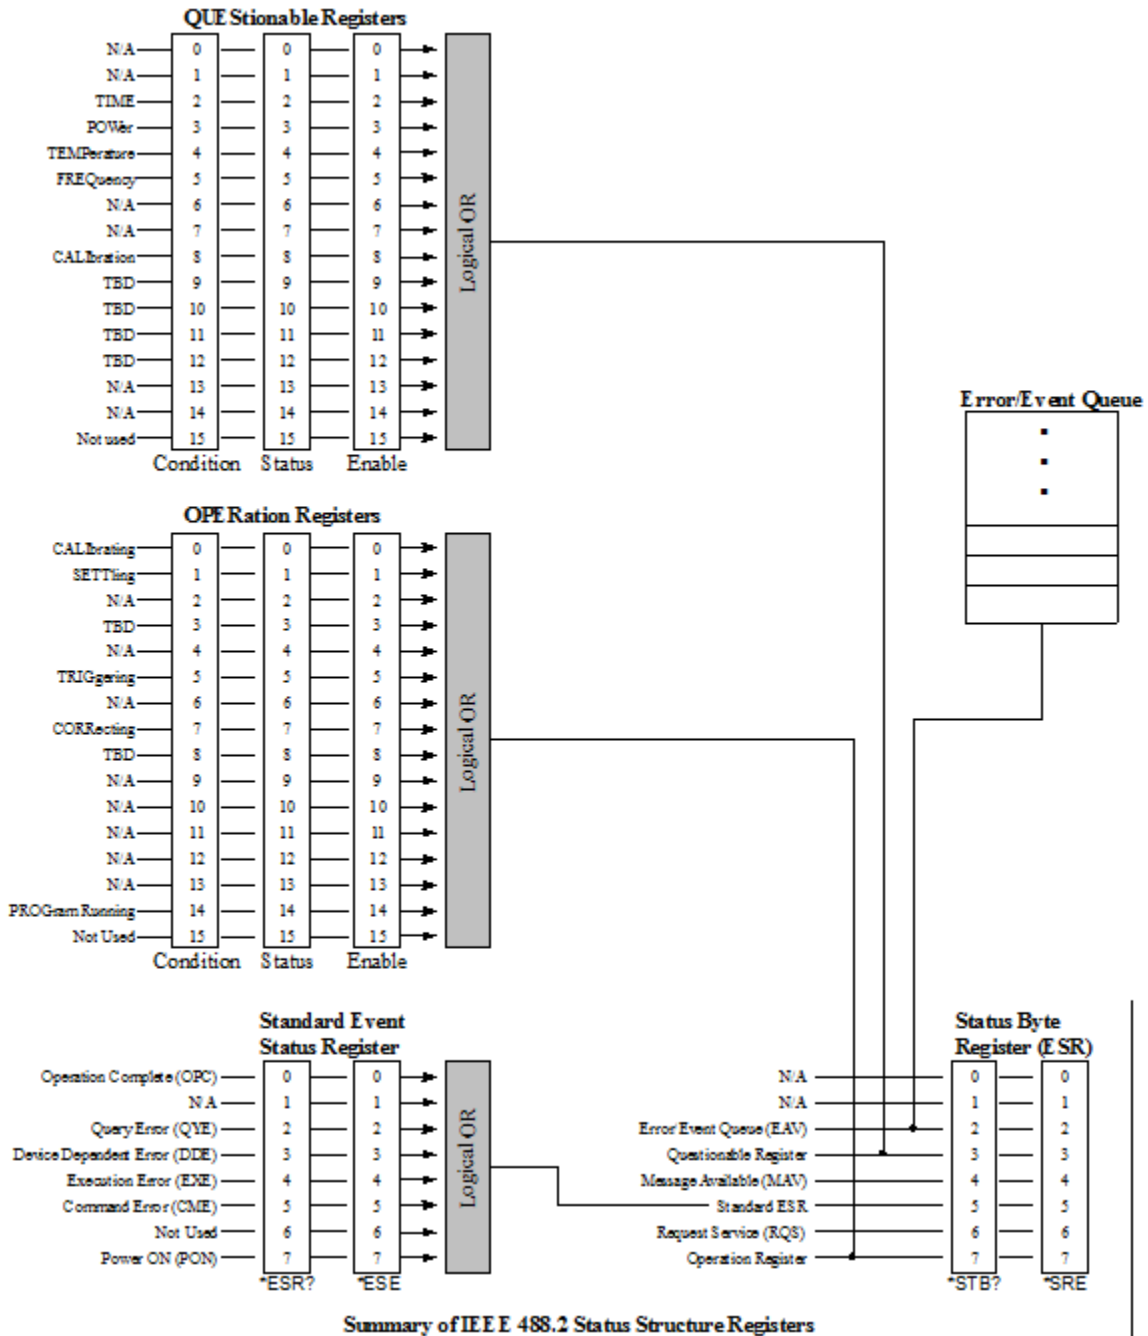

Figure 13: Status Reporting Structure with Status & Enable Registers

The STATUS commands control the SCPI-defined status-reporting structures as illustrated in Figure 13.

SCPI defines the QUESTionable, OPERation, INSTRument SUMMARY and INSTRument registers in addition to those in IEEE 488.2. These registers conform to the IEEE 488.2 specification and each may be comprised of a condition register, an event register, an enable register, and negative and positive transition filters.

SCPI also defines an IEEE 488.2 queue for status. The queue provides a human readable record of instrument events. The application programmer may individually enable events into the queue. :STATus:PRESET enables errors and disables all other events. If the summary of the queue is reported, it shall be reported in bit 2 of the status byte register. A subset of error/event numbers is defined by SCPI.

## :STATus:OPERation[:EVENT]?

This command queries the standard Operation Status Register (OSR) for any event. The query returns the decimal sum of the bits set in the OSR. The decimal sum is the binary equivalent of the 16-bit mask. The last bit is unused. Any specific bit in the OSR will only appear set if and only if its event has occurred and the corresponding bit in the OSE is also enabled (refer to [Appendix D: SCPI Status and Event Registers](#)).

---

**Caution:** This query clears all bits in the register to 0.

---

See [Figure 13](#) for the Operation Status register bits mapping.

<b>Syntax</b>	:STATus:OPERation[:EVENT]?
<b>Parameter</b>	None
<b>Response</b>	<integer>
<b>Output Values</b>	0 – 32767 ( $2^{15}-1$ )
<b>*RST State</b>	None
<b>Example</b>	:STAT:OPER?

## :STATus:OPERation:CONDition?

This command queries the standard Operation Condition Register (OCR) for any questionable event. The query returns the decimal sum of the bits set in the OCR. The decimal sum is the binary equivalent of the 16-bit mask. The last bit is unused. Any specific bit in the OCR will only appear set if and only if its event has occurred and the corresponding bit in the OSE is also enabled (see [:STATus:OPERation:ENABLE](#) section). The content of the OCR remains unchanged after it is read.

The data in this register is continuously updated to reflect the most current conditions.

See [Figure 13](#) for the Operation Condition register bits mapping.

<b>Syntax</b>	:STATus:OPERation:CONDition?
<b>Parameter</b>	None
<b>Response</b>	<integer>
<b>Output Values</b>	0 – 32767 ( $2^{15}-1$ )
<b>*RST State</b>	None
<b>Example</b>	:STAT:OPER:COND?

## :STATus:OPERation:ENABLE

This command enables or queries bits in the Operation Enable register (OER). The decimal integer value entered is the binary equivalent of the desired 16-bit mask to be

enabled. Bits enabled in this register allow accessing the equivalent bits status in the OSR and OCR registers.

Bits enabled in OER and set in OSR/OCR register will result in the Standard Operation Status Summary bit (bit 7) in the STB register being set. See [Figure 13](#).

<b>Syntax</b>	:STATus:OPERation:ENABle <integer> :STATus:OPERation:ENABle?
<b>Parameter/Response</b>	<integer>
Allowable Values	0 – 32767 ( $2^{15}-1$ )
*RST State	0
Examples	:STAT:OPER:ENAB 256 :STAT:OPER:ENAB?

## :STATus:PRESET

This command presets the RTSA7500 (similar to \*RST), and OSE and QSE to zero.

<b>Syntax</b>	:STATus:PRESET
<b>Parameter/Response</b>	None

## :STATus:QUEStionable[:EVENT]?

This command queries the standard Questionable Status Register (QSR) for any event. The query returns the decimal sum of the bits set in the QSR. The decimal sum is the binary equivalent of the 16-bit mask. The last bit is unused. Any specific bit in the QSR will only appear set if and only if its event has occurred and the corresponding bit in the QSE is also enabled (refer to [Appendix D: SCPI Status and Event Registers](#)).

---

**Caution:** This query clears all bits in the register to 0.

---

See [Figure 13](#) for the Questionable Status register bits mapping.

<b>Syntax</b>	:STATus:QUEStionable[:EVENT]?
<b>Parameter</b>	None
<b>Response</b>	<integer>
Output Values	0 – 32767 ( $2^{15}-1$ )
*RST State	None
Example	:STAT:QUES?

## :STATus:QUEStionable:CONDition?

This command queries the standard Questionable Condition Register (QCR) for any questionable event. The query returns the decimal sum of the bits set in the QCR. The decimal sum is the binary equivalent of the 16-bit mask. The last bit is unused. Any specific bit in the QCR will only appear set if and only if its event has occurred and the corresponding bit in the QSE is also enabled (refer to [Appendix D: SCPI Status and Event Registers](#)). The content of the QCR remains unchanged after it is read.

The data in this register is continuously updated to reflect the most current conditions.

See [Figure 13](#) for the Questionable Condition register bits mapping.

**Syntax** :STATus:QUEStionable:CONDition?  
**Parameter** None  
**Response** <integer>  
Output Values 0 – 32767 ( $2^{15}-1$ )  
\*RST State None  
Example :STAT:QUES:COND?

## **:STATus:QUEStionable:ENABLE**

This command enables bits in the Questionable Enable register (QER). The decimal integer value entered is the binary equivalent of the desired 16-bit mask to be enabled. Bits enabled in this register allow accessing the equivalent bits status in the QSR and QCR registers.

Bits enabled in QER and set in QSR/QCR register will result in the Standard Questionable Status Summary bit (bit 3) in the STB register being set. See [Figure 13](#).

**Syntax** :STATus:QUEStionable:ENABLE <integer>  
:STATus:QUEStionable:ENABLE?  
**Parameter/Response** <integer>  
Output Values 0 – 32767 ( $2^{15}-1$ )  
\*RST State 0  
Examples :STAT:QUES:ENAB 256  
:STAT:QUES:ENAB?

## **:STATus:TEMPerature?**

This command queries the RTSA 7500's internal temperature provided by one or more temperature sensors. The response field varies depending on how many sensors are available in a RTSA 7500 model. The RTSA7500 model, for instance, returns comma separated values for the sensors at the RF, Mixer and Digital sections.

**Syntax** :STATus:TEMPerature?  
**Parameter** None  
**Response** <NRf>{,<NRf>}  
For RTSA7500: <RF>,<Mixer>,<Digital>  
Output Data Type Float  
Unit degrees Celsius  
\*RST State None

## **INPut Commands**

### **:INPut:ATTenuator**

This command enables, disables or queries the RTSA7500's RFE 20dB attenuation.

---

**Note:** This command applies to RTSA7500-2XX, -3XX, -408 and their variants only. It is not applicable for -408P, -418 and -427 and their variants, see :INPut:ATTenuator:VARiable command instead.

---

**Syntax** :INPut:ATTenuator <Boolean>  
:INPut:ATTenuator?

**Parameter** ON | OFF | 1 | 0

Input Data Type Integer | Character

**Query Response** 1 | 0

Output Data Type Integer

\*RST State 1

Examples :INP:ATT ON  
:INPUT:ATT?

## :INPut:ATTenuator:VARiable

This command sets or queries the variable attenuation of the RTSA7500's RFE.

---

**Note:** This command applies to RTSA7500-408P, -418, -427, and their variants only. For RTSA7500 -2XX, -3XX, -408 and their variants, see :INPut:ATTenuator command instead.

---

**Syntax** :INPut:ATTenuator:VARiable <integer [dB]>  
:INPut:ATTenuator?

**Parameter** <Attenuation [dB]>

Input Data Type Integer, optional character unit

Allowable Values 0 – 25 dB

**Query Response** <integer>

\*RST State 0

Examples :INP:ATT:VAR 5  
:INPUT:ATT:VAR?

This command is not available for sweep mode. The desired attenuation should be set before sweep mode starts.

## :INPut:FILTer:PRESelect

This command sets or queries the RFE preselect filter selection.

**Syntax** :INPut:FILTer:PRESelect <Boolean>  
:INPut:FILTer:PRESelect?

**Parameter** ON | OFF | 1 | 0

Input Data Type Integer | Character

**Query Response** 0 | 1

Output Data Type Integer

\*RST State 0

Examples :INP:FILT:PRES ON

:INP:FILTER:PRES?

## :INPut:GAIN

This command sets or queries the input gain stage for a RTSA 7500. The number of gain stages is dependent on the models as listed below. Any out of range index will result in an Execution Error response. Contact BNC's Support for further details and the gain ranges of each stage.

**Syntax** :INPut:GAIN <Index> <Boolean>  
:INPut:GAIN? <Index>

**Parameter** <Integer> <ON | OFF | 1 | 0>

Input Data Type <Integer> <Character | Integer>

Allowable Values Index: Varies depending on the product model. For example:  
- RTSA7500-408: 1  
- RTSA7500-408P, 418, 427 and their variants: 1, 2, 3  
Boolean: ON | OFF | 1 | 0

**Query Response** 1 | 0

Output Data Type Integer

\*RST State 1 for all available stages

Examples :INPUT:GAIN 2 ON  
:INP:GAIN? 1  
:INP:GAIN 1 0

---

**Note:** The reference level context information (see page 33) is **only valid** when all the gain stages are enabled for RTSA7500-408P, 418, 427 and their variants.

---

## :INPut:GAIN:IF

This command sets or queries variable IF gain stages of the RFE.

**Syntax** :INPut:GAIN:IF <NR1 [unit]>  
:INPut:GAIN:IF? [MAX | MIN]

**Parameter** <Gain value [unit]>

Input Data Type Signed integer [character]

Allowable Values 0 to 30

**Query Response** <NR1>

Output Data Type Integer

Default I/O unit dB

\*RST State 0

Examples :INPUT:GAIN:IF -2  
:INP:GAIN:IF 20 dB  
:INP:GAIN:IF?

## :INPut:GAIN:HDR

This command sets or queries variable NB IF gain of the HDR signal path.

**Syntax** :INPut:GAIN:HDR <NR1 [unit]>

	:INPut:GAIN:HDR? [MAX   MIN]
<b>Parameter</b>	<NR1 [unit]>
Input Data Type	Signed integer [character]
Allowable Values	-10 to 34
<b>Query Response</b>	<NR1>
Output Data Type	Signed integer
Default I/O unit	dB
*RST State	25
Examples	: INPUT:GAIN:HDR -5 : INP:GAIN:HDR 20 dB : INP:GAIN:HDR?

## :INPut:MODE

This command sets or queries the RTSA7500's RFE mode of operation.

---

**Notes:** The RFE modes affect the data packing method due to the different output data width. The type of DSP applied would also change the data output of some of the modes as well. For example, SH mode with frequency shift would change from I<sub>14</sub> only data to I<sub>14</sub>Q<sub>14</sub> data output. The VRT's Stream ID would identify the format accordingly. See [Table 2: Radio RFE Modes and DSP Data Output Formats](#) (page 18) and VRT's IF Data Packet Class (page 36).

- It is also important to see [Table 2](#) for the IBW of each mode and the related notes.
  - If :OUTput:IQ:MODE CONNector is to be used with SH or SHN mode, see the Important Note listed under that command.
- 

<b>Syntax</b>	:INPut:MODE ZIF   DD   HDR   IQIN <sup>1</sup>   SH   SHN <sup>2</sup>   HIF <sup>4</sup> :INPut:MODE?
<b>Parameter/Response</b>	ZIF   DD   HDR   IQIN <sup>1</sup>   SH   SHN <sup>2</sup>   HIF <sup>4</sup>
I/O Data Type	Character
*RST State	<i>Product version dependent</i> <sup>3</sup>
Examples	: INP:MODE HDR : INPUT:MODE?

<sup>1</sup> IQIN mode is not available in RTSA7500 product version 2.2. See \*IDN? to find out your product version (or the Administrative web-console to the box).

<sup>2</sup> SHN mode is only available in RTSA7500 hardware revision 3 (product version 1.3) onward. See \*IDN? to find out your hardware version (or the Administrative web-console to the box).

<sup>3</sup> The RFE mode availability is product dependent. Hence, the \*RST state and the initial power-up default would be different depending on the product version.

<sup>4</sup> The HIF mode is only available for RTSA7500-XXX-HIF model, which is indicated through the command :SYSTem:OPTions? with the response code 002. When this model is used, the INPut:MODE[?] command will only take/response with the DD and HIF parameters.

## SOURce Commands

### :SOURce:REFeRence:PLL

This command selects and queries the 10MHz reference clock source, whether it be via the internal source or through the external SMA connector.

**Caution:** When the external 10MHz reference is used, its reference level **must be between -10dBm and 0dBm**. Exceeding the level of 0dBm will result in permanent damage to the internal clock circuit. Additionally, the 10MHz reference must be powered down prior to powering down the RTSA7500.

---

<b>Syntax</b>	:SOURce:REFeRence:PLL INT   EXT :SOURce:REFeRence:PLL?
<b>Parameter/Response</b>	INT   EXT
I/O Data Type	Character
*RST State	INT
Examples	: SOURCE : REF : PLL INT : SOUR : REF : PLL ?

### :SOURce:REFeRence:PLL:RESEt

This command resets the 10MHz reference clock in to the internal source.

<b>Syntax</b>	:SOURce:REFeRence:PLL:RESEt
<b>Parameter/Response</b>	None
*RST State	INT
Examples	: SOURCE : REF : PLL : RESEt

## SENSE Commands

### [:SENSe]:CORRection:DCOFFset

This command sets or queries the ADC's DC-offset correction state.

<b>Syntax</b>	[:SENSe]:CORRection:DCOFFset <Boolean> [:SENSe]:CORRection:DCOFFset?
<b>Parameter</b>	ON   OFF   1   0
Input Data Type	Integer   Character
<b>Query Response</b>	0   1
Output Data Type	Integer
*RST State	1
Examples	: SENS : CORR : DC OFF CORR : DC ?

## [:SENSe]:DECimation

This command sets or queries the rate of decimation of samples in a trace capture. When the rate is set to 1 (or OFF), no decimation is performed on the trace capture. The decimation range varies depending on the RFE modes as described below.

In HDR mode, the decimation is done directly by the on-board NB ADC. The decimation value supported by this mode is 1, 2 and 4.

In the remaining RFE modes, RTSA7500 uses DDC to provide 10 levels of decimation of values 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024 (i.e. decimation rate =  $2^{\text{level}}$  where level = 1, 2 – 10). The decimation process consists of CIC and FIR filters, each type of filters with its own decimator. The decimator captures one sample at every <integer> number of samples. The filters are arranged in the following manner:

- For the decimation rate of 4, only a FIR filter with a fixed decimation by 4 is used, CIC filter is bypassed.
- For the decimation rates of 8 to 1024, a 4-stage CIC of rate 4 to 512 is applied first for each I and/or Q data. The resulting I and/or Q data pipes are then passed to a FIR filter with a fixed decimation of 2 to arrive at the rate set. For example, for a rate of 16, I and Q data will first pass-through the CIC filters with a decimation rate of 8. The CIC output will be further decimated by 2 by the FIR filter which has a fixed decimation rate of 2.

**Note:** When in SH/SHN mode and a decimation is on, the RTSA7500 will automatically be shifted by 55MHz in WBIQ model or 35MHz in all others to the zero IF before decimation is applied. This implies **the VRT data output will be I and Q for SH/SHN with decimation.**

---

<b>Syntax</b>	:SENSe:DECimation OFF   <integer> :SENSe:DECimation? [MAX   MIN]
<b>Parameter</b>	OFF   <decimation value>
<b>Input Data Type</b>	Integer   Character
<b>Allowable Values</b>	In HDR mode: OFF, 1, 2, 4  For ZIF, SH, SHN modes: OFF, 1, 2, 4, 8, 16, 32, 64, 128, 256, 512 and 1024
<b>Query Response</b>	1      Equivalent to decimation off. In HDR mode: 1, 2, 4  For ZIF, SH, SHN modes: 1, 2, 4, 8, 16, 32, 64, 128, 256, 512 and 1024
<b>Output Data Type</b>	Integer
<b>*RST State</b>	1
<b>Examples</b>	:DEC 16 :SENSe:DEC OFF

## **[[:SENSe]:FREQUency:CENTer**

This command sets or queries the center frequency of the RTSA 7500 with one exception. For the DD and IQIN modes, this command does not apply (however, [[:SENSe]:FREQUency:SHIFt command is still applicable to those modes).

The frequency resolution varies depending on the RFE modes of operation. ZIF, SH and SHN signal paths utilize the WB ADC; thus, the frequency tuning resolution is 10Hz. For those receiver modes, the resolution can be down to the nearest 1Hz resolution ( $\pm 0.23\text{Hz}$ ) using [[:SENSe]:FREQUency:SHIFt command. While for HDR receiver mode, the frequency resolution is 10Hz without further frequency shifting capability. Refer to RF Receiver Front-End (page 17) for more details.

For example, the system is in ZIF mode, to tune to a frequency of 2441.16MHz require the sending of two commands: [[:SENSe]:FREQUency:CENTer 2441.1MHz and [[:SENSe]:FREQUency:SHIFt 6kHz. The set values can be verified by querying. If a valid frequency with an inappropriate resolution is set, the frequency value will be rounded down to the nearest valid resolution, no error is set.

In addition, depending on the product models, the allowable range of programmable frequencies varies. Check with your product's data sheet. For example, RTSA7500-408 has a range of 0.1 to 8GHz, while RTSA7500-427 has 0.1 to 27GHz.

<b>Syntax</b>	[[:SENSe]:FREQUency:CENTer <NRf [unit]> [[:SENSe]:FREQUency:CENTer? [MAX   MIN]
<b>Parameters</b>	<center frequency [unit]>
Input Data Type	Double [character]
Allowable Values	<b><i>Varies depending on the product model</i></b>
<b>Query Response</b>	<integer>
Default I/O Unit	Hz
*RST State	2400000000
Examples	:FREQ:CENTer 2441.5 MHz SENSe:FREQ:CENT 200000000 :FREQ:CENT 2.01 GHZ SENSe:FREQ:CENTer?

## **[[:SENSe]:FREQUency:IF?**

This command queries the IF frequencies that are used for the current input mode and center frequency.

This command works in all RTSA7500 models but the number and significance of the IF frequencies will vary depending on the model and configured options (see :SYSTem:OPTions? command). The IF index can be specified either as a positive number (1 to N) where 1 indicates the first IF mixing stage after the input from the front end, or as a negative number (-1 to -N) where -1 indicates the last IF before the digitizer input or at the output connector in certain models (e.g. HIF option). If the input index is beyond the number of available IFs, :SYSTem:ERRor[:NEXT]? will return a -222, "Data out of range" response.

<b>Syntax</b>	[[:SENSe]:FREQUency:IF? <non-zero integer>
<b>Parameters</b>	<IF index>
Input Data Type	Non-zero Integer

Allowable Values	<i>Varies depending on RFE input mode, frequency, product model and options</i>
<b>Query Response</b>	IF frequency
Output Data Type	<integer>
Default Output Unit	Hz
*RST State	N/A
Examples	SENSE:FREQ:IF? -1

## **[[:SENSe]:FREQuency:LOSCillator?**

This command queries the frequency to be set for the external local oscillator (LO) 1 or 2 in corresponding to current the RTSA 7500's center frequency.

**Note:** This command ONLY works with RTSA7500s that have the external LO option (see :SYSTem:OPTions? command). And when a RTSA7500 supports the external LO input mode, **the RFE's IQIN mode will not be available**. Issuing :INPut:MODE IQIN will result in a SCPI error being returned. Please see "The Use of BNC Products with External Local Oscillators" AppNote for more important details.

<b>Syntax</b>	[[:SENSe]:FREQuency:LOSCillator? <1   2   3>
<b>Parameter</b>	None
<b>Query Response</b>	<integer> 0 := LO Off
*RST State	1
Example	:FREQ:LOSC? 2

## **[[:SENSe]:FREQuency:SHIFt**

This command sets or queries the frequency shift value. A negative shift value corresponds to a left shifting.

This command is also used in additional to [[:SENSe]:FREQuency:CENTer to fine tune the RTSA 7500 down to 1Hz resolution.

**Note:** Frequency shift mode is not available for some RFE modes of operation. Also, when enabled, it would affect the data output format of some RFE modes. See [Table 2: Radio RFE Modes and DSP Data Output Formats](#) (page 18).

<b>Syntax</b>	[[:SENSe]:FREQuency:SHIFt <NRf [unit]> [:SENSe]:FREQuency:SHIFt? [MAX   MIN]
<b>Parameters</b>	<Frequency [unit]>
Input Data Type	Float [character]
Allowable Values	-62.5 – 62.5MHz
<b>Query Response</b>	<integer>
Default I/O Unit	Hz
*RST State	0
Examples	:FREQ:SHIF -10.5 MHz

```
SENSE:FREQ:SHIFT 20000000.0
SENSe:FREQ:SHIFT?
FREQ:SHIFT? MAX
```

## **[[:SENSe]:FREQUency:RESolution?**

This command queries the frequency resolution value.

<b>Syntax</b>	[[:SENSe]:FREQUency:RESolution?
<b>Parameter</b>	None
<b>Query Response</b>	<integer>
<b>Default Output Unit</b>	Hz
<b>Example</b>	:FREQ:RES?

## **[[:SENSe]:LOCK:REFerence?**

This command queries the lock status of the PLL reference clock in the digital card.

<b>Syntax</b>	[[:SENSe]:LOCK:REFerence?
<b>Parameter</b>	None
<b>Query Response</b>	0   1 1 Reference PLL is locked 0 Reference PLL is not locked
<b>Output Data Type</b>	Integer
<b>*RST State</b>	N/A
<b>Example</b>	LOCK:REF?

## **[[:SENSe]:LOCK:RF?**

This command queries the lock status of the RF VCO (Voltage Control Oscillator) in the RFE.

<b>Syntax</b>	[[:SENSe]:LOCK:RF?
<b>Parameter</b>	None
<b>Query/Response</b>	0   1 1 RF PLL is locked 0 RF PLL is not locked
<b>Output Data Type</b>	Integer
<b>*RST State</b>	N/A
<b>Example</b>	LOCK:RF?

## **OUTput Commands**

### **:OUTput:IQ:MODE**

This command sets or queries the RTSA7500's IQ output path to use the digitizer section for data output or the direct output to the IQ connector port of the RTSA 7500.

---

### Important Notes:

- When the CONNector option is selected:

+ all commands affecting the digitizer data path of the RTSA7500 will not apply, these include TRACe Commands, level triggering (:TRIGger:LEVel) and digital signal processing ([:SENSE]:DECimation or :SWEep:ENTRy:DECimation, [:SENSE]:FREQUency:SHIFt and :SWEep:ENTRy:FREQUency:SHIFt).

+ no VRT context packets will be sent out from the RTSA 7500.

+ when use with :INPut:MODE SH or SHN, the spectral inversion solution as suggested in [Table 35](#) is required depending on the frequency input. The spectral inversion indicator is available through the GPIO port. Contact BNC's Support for further details.

- The CONNector mode only works on certain RTSA7500 model. Verify that your product supports this method. A system error will be returned if the model does not accept this option.

---

<b>Syntax</b>	:OUTput:IQ:MODE :OUTput:IQ:MODE?
<b>Parameter/Response</b>	CONNector   DIGitizer
I/O Data Type	Character
*RST State	DIGITIZER
Examples	:OUT:IQ:MODE CONNector :OUTPUT:IQ:MODE?

### :OUTput:IQ:CONNector:INVersion?

This query only command is used to determine if a spectral inversion is required on the data output at the IQ OUT connector at a given frequency, regardless of the DSP mode enabled. See [Table 35](#) for more information on spectral inversion.

This command is not available for the sweep entry subset of commands. However, this command can be used iteratively during say initialization stage to query the frequency range of interest. The results can then be stored in a look-up table, for example.

<b>Syntax</b>	:OUTput:IQ:CONNector:INVersion? [NRf [unit]]
<b>Parameters</b>	Optional [center frequency [unit]]
Input Data Type	[Double [character]]
Default Input Unit	Hz
Allowable Values	<b><i>Varies depending on the product model</i></b>
<b>Query Response</b>	1   0 where 1 is equivalent to the inversion is required
Output Data Type	Integer
*RST State	N/A
Examples	:OUT:IQ:CONN:INV? 2441.5 MHz OUT:IQ:CONN:INV?

# TRIGger Commands

## :TRIGger:TYPE

This command sets or queries the type of trigger event. Setting the :TRIGger:TYPE to NONE is equivalent to disabling the trigger execution, while setting to any other type will enable the trigger engine.

The LEVEL trigger type is condition by the start and stop frequencies range and the amplitude level. See the :TRIGger:LEVEL command.

The PULSE and WORD trigger types belong to the external synchronization trigger through a GPIO port (see External Triggering, page 23).

<b>Syntax</b>	:TRIGger:TYPE LEVEL   PERiodic   PULSE   WORD   NONE :TRIGger:TYPE?
<b>Parameter/Response</b>	LEVEL   PERIODIC   PULSE   WORD   NONE
I/O Data Type	Character
*RST State	NONE
Examples	:TRIG:TYPE LEVEL :TRIG:TYPE?

## :TRIGger:LEVEL

This command sets or queries the frequency range and amplitude of a frequency domain level trigger. If the sampled signal amplitude exceeds the defined trigger level at any single sample within the defined frequency range then the trigger will occur and the associated IQ data will be stored.

The frequency range encompasses all FFT bins of which their center frequencies are within the range defined by START and STOP. The defined START and STOP frequencies may exceed, but only affect, the range defined by the IBW (with consider of the DDC decimation) centered around the [:SENSE]:FREQUENCY:CENTER value.

Refer to the Frequency Domain Triggering section for more information.

<b>Syntax</b>	:TRIGger:LEVEL <NRf [unit]>,<NRf [unit]>,<NR1 [unit]> :TRIGger:LEVEL?
<b>Parameters/Response</b>	<start>,<stop>,<level>
Input Data Type	Comma separated values with: Frequency: Double [character] Level: signed integer value
Allowable Values	Frequency: See [:SENSE]:FREQUENCY:CENTER Levels: Dependent on the attenuation. When the attenuator is + off, -30dBm maximum + on, -10dBm maximum
Output Data Type	<integer>,<integer>,<signed integer>
Default I/O Units	Hz,Hz,dBm
*RST State	N/A (Trigger is off)
Examples	:TRIG:LEVEL 2000 MHZ,2100 MHZ,-70 DBM :TRIG:LEVEL 15000000,15050000,-50

:TRIG:LEVEL?

## :TRIGger:PERiodic

Further information will be provided in a future revision of this document.

## :TRIGger:STATus?

This command returns the status of the current enabled trigger as to whether it is pending or has occurred. It is cleared once the data buffer is cleared out.

<b>Syntax</b>	:TRIGger:STATus?
<b>Parameter</b>	None
<b>Query Response</b>	0   1 1        Trigger event occurred 0        No trigger event
<b>I/O Data Type</b>	Integer
<b>*RST State</b>	0
<b>Examples</b>	:TRIT:STAT?

## TRACe Commands

A "trace capture" consists of a set of continuous data samples, ranging from 128 samples to a maximum determined by the RTSA7500 version (see :TRACe:BLOCK:PACKets and :TRACe:SPPacket). Each data word is 32-bit wide, arranged differently depending on the :INPut:MODE and see VRT's Data Payload Format, page 38.

BNC's RTSA7500 data packet returned through a network is complied with the industry standard VRT protocol. Therefore, every data packet returned is encapsulated with a VRT header and a VRT trailer. In addition, the VRT packet format sets a limit on the maximum number of samples per packet. Refer to the "Receiver Context Class" subsection of the VITA-49 Radio Transport Protocol section for further details on the VRT packet organization.

To do a single **block** capture of continuous data, the total number of samples captured is determined by the number of samples per packet (:TRACe:SPPacket) and the number of packets per block (:TRACe:BLOCK:PACKets). When the block data capture command (:TRACe:BLOCK:DATA?) is issued, the RTSA7500 will capture and store the total number of samples into a buffer. Hence, the samples within a single block capture is continuous from one packet to the other, but not necessary between successive block capture commands issued.

In **streaming** mode, the number of samples per packet (:TRACe:SPPacket) must be set to determine the size of each packet coming back. The samples from one packet to another will be continuous until the sample loss indicator (aka overflow indicator) is detected within the trailer of the data packet. When this indicator is high in the current VRT packet, it indicates that data overflow occurs **after** the current captured packet, not within the packet. In other words, the samples of the immediate packet following after the current packet that has the sample loss indicator bit high are not continuous from those of the current packet.

---

**Note:** The :DECimation command can be used to slow down the capture rate, thus, effectively lowers the rate of discontinuity between packets to provide contiguous data stream of data.

---

The RTSA7500 can store up to 32 MSA of ZIF or 64 MSA of SH continuous data.

## :TRACe:BLOCK:DATA?

This command will start the single block capture and the return of all trace packets set by :TRACe:BLOCK:PACKets command, with each packet of the size set through :TRACe:SPPacket command. The data within a single block capture trace is continuous from one packet to the other, but not necessary between successive block capture commands issued.

<b>Syntax</b>	:TRACe:BLOCK:DATA?
<b>Parameter</b>	None
<b>Response</b>	Control port 37001: empty string Data port 37000: <NRr>
Output Data Type	Hexadecimal bytes
*RST State	N/A
Examples	:TRACE:BLOCK:DATA?

---

**Note:** The status of the query will be returned through the control port 37001 as usual, however the data will be returned through the data port 37000. Once the :TRACe:BLOCK:DATA? command is issued, a block of SPP \* PACKets of data will be returned. In other words, :TRACe:BLOCK:DATA? needs to be sent only once to get SPP \* PACKets block of data.

---

The returned data in each VRT packet is presented in continuous hexadecimal chunk, as shown here:

```
Response <NRr> ::= <VRT header bytes>{<data payload bytes>}
                  [<4 bytes VRT trailer>]
```

Further description on the VRT data output formats can be found in the VRT's IF Data Packet Class section, page [36](#).

## :TRACe:BLOCK:PACKets

This command sets or queries the total number of packets set in the RTSA 7500. The maximum is limited by the storage capacity of a RTSA7500 and the samples per packet (SPP) size set through :TRACe:SPPacket. Therefore, when :TRACe:BLOCK:PACKets? MAX query command is sent, the returned value will vary depending on the SPP value of a RTSA 7500 and the data output format. For example, the RTSA7500 has 128 MBytes storage capacity, if SPP is 32768 with I<sub>14</sub>Q<sub>14</sub> output format, then the maximum packet size is 1023 (or 128 MB / (4 bytes-per-sample \* (32768 + 6))). If I<sub>14</sub> is the output format, then the maximum is 2047 (or 128 MB \* / (2 bytes-per-sample \* (32768 + 6))).

In single block capture mode, this command is used in conjunction with the :TRACe:SPPacket command to set the total number of samples to capture. In other

words, the data from one packet to the next within a single block capture mode is continuous.

**Syntax** :TRACe:BLOCK:PACKets <integer>  
:TRACe:BLOCK:PACKets? [MAX | MIN]

**Parameter** <input packet value>  
[MAX | MIN] for query1 – (RTSA 7500's max storage storage capacity ÷ (# bytes-per-sample \* (SPP value + 6 Header and trailer words)))

**Input Data Type** Integer | Character

**Allowable Values** 1 – (RTSA 7500's max storage storage capacity ÷ (# bytes-per-sample \* (SPP value + 6 Header and trailer words)))

**Query Response** <integer>

\*RST State 1

**Examples** :TRACE:BLOCK:PACK 100  
:TRACE:BLOCK:PACK?

## :TRACe:SPPacket

This command sets or queries the number of Samples Per Packet (SPPacket). In block capture mode, it is used in conjunction with the :TRACe:BLOCK:PACKets command to set the total number of (continuous and contiguous) samples to capture.

The upper bound of the SPP is limited by the VRT's 16-bit Packet Size field less the VRT's headers and any optional fields (see IF Data Packet Class for more details). The 16-bit Packet Size defines the total number of 32-bit **words** in each packet, not **samples** which could have different bits per sample. However, the total samples must be a multiple of 32 due to the use of burst transfer method of the capture engine. The maximum SPP is, therefore, simplified to 65504 or  $(2^{16} - 32)$  for all data format.

The lower bound of the SPP is limited by the capture engine's minimal transfer requirement of 256 samples. [Table 37](#) summarizes the SPP boundary sizes and the required multiple values for different data output format.

Table 37: Max, Min, and Required Multiples for SPP and Samples-per-word for Different Data Output Format

Format	Samples-per-word	Min SPP Size	Max SPP Size	Required Multiples
{I14Q14}	1	256	65504	32
{I14}	2			
{I24}	1			

**Syntax** :TRACe:SPPacket <integer>  
:TRACe:SPPacket? [MAX | MIN]

**Parameter** <integer>  
[MAX | MIN] for query

**Input Data Type** Integer | Character

**Allowable Values** 256 – 65504, *must be a multiple of 32*

**Query Response** <integer>

\*RST State 1024

**Examples** :TRACE:SPP 4096  
:TRAC:SPP?

## :TRACe:STReam:STARt

This command begins the execution of the real time stream capture. It will also initiate data capturing. Data packets will be streamed (or pushed) from the RTSA7500 whenever data is available.

Through the sending of a VRT Extension Context Packet carrying the ID value, the use of an ID in this command is to indicate the beginning of new data packets belonging to a new stream start. Even though the start ID value is optional, a VRT Extension Context Packet with the New Stream Start ID (page 36) value will **always** be sent out after this command is received and before data packets of the new stream become available. When no ID value is provided, the default ID value 0 is returned in the Context Packet.

**Note:** Once :TRACe:STReam:STARt is issued, the RTSA 7500 will not accept any setting changes. Changes can be sent after :TRACe:STReam:STOP command is issued.

---

<b>Syntax</b>	:TRACe:STReam:STARt [ID]
<b>Parameter</b>	<Stream ID value>
Input Data Type	Unsigned 32-bit integer
<b>Response</b>	None
*RST State	0 (Stream stopped)
Examples	:TRAC : STREAM : START 1 :TRACe : STR : START

## :TRACe:STReam:STOP

This command stops the stream capture. After receiving the command, the RTSA 7500 system will stop when the current capturing VRT packet is completed with the required samples (as opposed to :SYSTem:ABORT).

**Note:** After this command is issued, :SYSTem:FLUSh command should be issued as well as to clear up any data remained in the internal memory.

---

<b>Syntax</b>	:TRACe:STReam:STOP
<b>Parameter/Response</b>	None
*RST State	N/A (Stream stopped)
Examples	:TRACe : STREAM : STOP :TRAC : STREAM : STOP

## SWEEp Commands

**Note:** Currently, only one single sweep list is supported. Thus, some description on list in this section might not apply. For example, the string identifier is not needed yet, neither is list editing as there is only one list. The entries, however, can be configured as described.

---

A sweep control setup consists of defining one or more sweep lists and one or more entries for each list. The sweep execution is controlled by issuing the commands (such as start, stop or resume) listed under :LIST.

A sweep list can be thought of as being similar to a spreadsheet or table where the columns define the different specific capture engine configurations (such as :ANTenna, :FREQuency and :DECimation), and the rows as sweep entries with each consisting of a sweep frequency or range and its associated capture engine configurations.

A :SWEep:LIST is created and identified using a unique string identifier set by the user. A list may be edited, deleted and/or executed using the :SWEep:LIST command set. Each list is executed indefinitely or a finite number of time as determined by the :ITERations command.

*More information will be provided in the future revision of this document for multiple lists handling.*

The :SWEep:ENTRy commands provide the ability to define the capture engine configurations for each sweep entry including the equivalent of :INPut, :SENSe and :TRIGger commands. There may be any number of entries in a sweep list for up to 500. Sweep entries are identified by an index number and may be inserted, edited and/or deleted like rows in a table or spreadsheet. A sweep entry is created by using either :NEW or :COPY and :SAVE command. The entry will not be part of a list until :SAVE is issued.

If trigger is defined for an entry, captured data is returned only if a trigger event occurred. Otherwise, when the :DWEll time is reached, the trigger is aborted and the next sweep entry will be executed.

During sweeping, the RTSA 7500 internal buffer might be overflowed, at which point the sweep engine will pause. The engine will resume sweeping once there are enough space for the next "block" of data or more.

The engine will stop when the iterations have been reached or either a :SYSTem:ABORt or :SWEep:LIST:STOP command has been issued.

---

#### **Notes:**

- Unlike with [:SENSe]:FREQuency:CENTer, the center frequency command of a sweep entry can take a frequency range and the step size as the parameters.
  - Unlike :TRACe:BLOCK capture, sweep mode data packets, whether VRT context or digitized data, are "streamed" (similar to :TRACe:STReam). As soon as :SWEep:LIST:STARt command is issued, this will initiate also the data capturing and data packets will be "pushed" from the RTSA7500 when available.
  - When sweep is stopped, the RTSA 7500 will retain the settings of the last performed sweep entry when :STOP command is received and executed. Any non-sweep commands can then be operated on the RTSA 7500. When the :SWEep is resumed (:STARt), the settings as per the sweep entries are executed.
  - When the RTSA 7500 is sweeping, any non-sweep commands sent will result in an error and are not executed. The sweep will not be affected and keep on running. However, sweep related settings can still be changed while sweep is running.
- 

### **:SWEep:LIST:ITERations**

This command sets or queries the number of times the sweep list is repeated.

**Syntax** :SWEep:LIST:ITERations <integer>  
:SWEep:LIST:ITERations?

**Parameter** <integer>

Allowable Values 0 – 4294967295 (or  $2^{32} - 1$ )  
0 := infinity

**Query Response** <integer>

I/O Data Type Integer

\*RST State 0

Examples :SWEEP:LIST:ITER 10  
:SWE:LIST:ITER?

## :SWEep:LIST:START

This command begins the execution of the current sweep list from the first entry.

This command will also initiate data capturing. Data packets will be streamed (or pushed) from the RTSA7500 whenever it is available.

Through the sending of a VRT Extension Context Packet carrying the ID value, the use of an ID in this command is to indicate the beginning of new data packets belonging to a new sweep start. Even though the start ID value is optional, a VRT Extension Context Packet with the New Sweep Start ID (page 36) value will **always** be sent out after this command is received and before data packets of the new sweep become available. When no ID value is provided, the default ID value 0 is returned in the Context Packet.

**Syntax** :SWEep:LIST:START [ID]

**Parameter** <List ID>

Input Data Type Unsigned 32-bit integer

**Response** None

\*RST State 0 (Sweep stopped)

Examples :SWEEP:LIST:STAR  
:SWE:LIST:START

## :SWEep:LIST:STATus?

This query returns the current status of the sweep engine.

**Syntax** :SWEep:LIST:STATus?

**Parameter** None

**Query Response** RUNNING | STOPPED

Output Data Type Character

\*RST State STOPPED

Examples :SWEEP:LIST:STATUS?  
:SWE:LIST:STAT?

## **:SWEep:LIST:STOP**

This command stops the sweeping and stores the entry index where it is stopped. The RTSA 7500 retains the settings of the last performed sweep entry when :STOP command is executed.

<b>Syntax</b>	:SWEep:LIST:STOP
<b>Parameter/Response</b>	None
<b>*RST State</b>	N/A (Sweep stopped)
<b>Examples</b>	:SWEEP:LIST:STOP :SWE:LIST:STOP

---

**Note:** This command should be issued to clear the RTSA7500's data buffer of any data that has not been sent from the RTSA7500 prior to setting up the next capturing process.

---

## **:SWEep:ENTRY:COPY**

This commands will copy and populate all the capture engine configurations under :SWEep:ENTRy with values from the sweep entry of the specified index. No new entry is created until :SWEep:ENTRy:SAVE command is issued and any changes will not affect the existing entry.

<b>Syntax</b>	:SWEep:ENTRy:COPY <integer>
<b>Parameter</b>	<Sweep entry integer index>
<b>Input Data Type</b>	Unsigned integer
<b>Allowable Values</b>	If :COUNT? returns non-zero, 1 to :COUNT? value If :COUNT? returns zero, an execution error is returned
<b>Query Response</b>	None
<b>*RST State</b>	N/A
<b>Examples</b>	:SWEEP:ENTR:COPY :SWE:ENTRY:COPY

## **:SWEep:ENTRy:COUNT?**

This query command returns the number of entries available in a list.

<b>Syntax</b>	:SWEep:ENTRy:COUNT?
<b>Parameter</b>	None
<b>Query Response</b>	<integer>
<b>Output Data Type</b>	Integer
<b>*RST State</b>	N/A
<b>Examples</b>	:SWEEP:ENTR:COUNT?

## **:SWEep:ENTRy:DELETE**

This commands delete one or all the entries. When an entry is deleted, the following indexes if existed will be reduced by one accordingly, just as rows in a spreadsheet.

**Syntax** :SWEep:ENTRy:DELETE <integer> | ALL  
**Parameter** <Entry index value> | ALL  
 Input Data Type Integer | Character  
 Allowable Values 1 to COUNT? value  
 \*RST State N/A  
 Examples :SWEEP:ENTR:DELETE 5  
 :SWE:ENTR:DELETE ALL

## :SWEep:ENTRy:NEW

This commands will populate all the capture engine configurations under :SWEep:ENTRy with default values. No new entry is created until :SWEep:ENTRy:SAVE command is issued.

**Syntax** :SWEep:ENTRy:NEW  
**Parameter/Response** None  
 \*RST State N/A  
 Examples :SWEEP:ENTR:NEW

## :SWEep:ENTRy:READ?

This query command returns the current configuration settings of a sweep entry.

**Syntax** :SWEep:ENTRy:READ? <integer>  
**Parameter** [Entry index value]  
 Input Data Type Integer  
 Allowable Values 1 to COUNT? value  
**Query Response** <integer>,<{integer | char}>  
 ::= <RFE mode>,<freq start>,<freq stop>,<freq step>,<freq shift>,<decimation>,<attenuator>,<IF gain>,<HDR gain>,<SPPacket>,<packets>,<dwel:second>,<dwel:microsecond>,<trigger type: NONE | PULSe | WORD | <LEVel,freq start,freq stop, amplitude>>  
 Output Data Type Comma separated integer and character values  
 \*RST State N/A  
 Examples :SWEEP:ENTR:READ? 5  
 :SWE:ENTR:READ? 1

## :SWEep:ENTRy:SAVE

This command saves a new entry into the current editing list with all the current capture engine configurations under :SWEep:ENTRy. The saving is done by inserting either the new entry **before** the specified index value or to the end of the list when no index value is given.

When saved, a new entry is given an index value. Index value starts from 1. When an index value is specified along with the :SAVE command, the new entry will take the index of that value and all other following indexes will be incremented by one accordingly, just as rows in a spreadsheet. Otherwise, the new index will be one up from the index of the last sweep entry in the list.

When there are no existing entries and an index value other than 1 is specified, an error will be returned. Similarly for non-existing index location except if the index value is equal to the value returned by :SWEep:ENTRy:COUNT? plus one.

<b>Syntax</b>	:SWEep:ENTRy:SAVE [integer]
<b>Parameter</b>	[Entry index value]
Input Data Type	Integer
Allowable Values	:COUNT? value + 1
*RST State	N/A
Examples	:SWEEP:ENTR:SAVE :SWE:ENTR:SAVE 5

### **:SWEep:ENTRy:ATTenuator**

Refers to the :INPut:ATTenuator section (page 59) for the definition of this command.

Examples	:SWEEP:ENTRy:ATTENUATOR ON :SWEEP:ENTR:ANT?
----------	--

### **:SWEep:ENTRy:DECimation**

Refers to the [:SENSe]:DECimation section (page 64) for the definition of this command.

Examples	:SWEEP:ENTR:DEC 16 :SWEEP:ENTRy:DEC?
----------	---

### **:SWEep:ENTRy:FILTer:PRESelect**

Refers to the :INPut:FILTer:PRESelect section (page 60) for the definition of this command.

Examples	:SWEEP:ENTR:FILT:PRES ON :SWEEP:ENTRy:FILTER:PRES?
----------	---

### **:SWEep:ENTRy:FREQUency:CENTer**

This command or query defines the center frequency or a range of center frequencies to sweep. When a range is provided, the sweep will step through the center frequencies with the value provided by :SWEep:ENTRy:FREQUency:STEP.

<b>Syntax</b>	:SWEep:ENTRy:FREQUency:CENTer <NRf [unit]>[,<NRf [unit]>] :SWEep:ENTRy:FREQUency:CENTer?
<b>Parameter</b>	<start freq [unit]>[,<stop freq [unit]>]
Input Data Type	Double [character]   Comma separated doubles [character]
Allowable Values	<b>Varies depending on the product model</b>
<b>Query Response</b>	<integer>,<integer>
Default I/O Units	Hz
*RST State	2400000000,2480000000
Examples	:SWEEP:ENTRy:FREQ:CENT 0,10 GHZ

```
:SWE:ENTRY:FREQ:CENT 2400 MHZ, 6 GHZ
:SWE:ENTR:FREQ:CENT 2400000000
:SWEEP:ENTRY:FREQ:CENTER?
```

## **:SWEep:ENTRy:FREQuency:STEP**

This command or query defines the frequency step size for the sweep center frequency range specified by :SWEep:ENTRy:FREQuency:CENTer command. If a range is not given, the step size is ignored.

<b>Syntax</b>	:SWEep:ENTRy:FREQuency:STEP <NRf [unit]> :SWEep:ENTRy:FREQuency:STEP?
<b>Parameter</b>	<freq [unit]>
<b>Input Data Type</b>	Double [character]
<b>Allowable Values</b>	0 – Maximum frequency of the RTSA7500 model used
<b>Query Response</b>	<integer>
<b>Default I/O Units</b>	Hz
<b>*RST State</b>	100000000
<b>Examples</b>	:SWEEP:ENTRY:FREQ:STEP 10.5 MHZ :SWE:ENTRY:FREQ:STEP 4000 KHZ :SWEEP:ENTR:FREQ:STEP 10000000 :SWEEP:ENTR:FREQ:STEP?

## **:SWEep:ENTRy:FREQuency:SHIFt**

Refers to the [:SENSe]:FREQuency:SHIFt section (page 66) for the definition of this command.

```
Examples :SWEEP:ENTR:FREQ:SHIFT 25 MHZ
:SWEEP:ENTRY:FREQ:SHIF?
```

## **:SWEep:ENTRy:GAIN:HDR**

Refers to the :INPut:GAIN:HDR section (page 61) for the definition of this command.

```
Examples :SWEEP:ENTR:GAIN:HDR -10
:SWEEP:ENTRY:GAIN:HDR?
```

## **:SWEep:ENTRy:GAIN:IF**

Refers to the :INPut:GAIN:IF section (page 61) for the definition of this command.

```
Examples :SWEEP:ENTR:GAIN:IF -10
:SWEEP:ENTRY:GAIN:IF?
```

## **:SWEep:ENTRy:MODE**

Refers to the :INPut:MODE section (page 62) for the definition of this command.

```
Examples :SWEEP:ENTRY:MODE ZIF
:SWE:ENTR:MODE?
```

## **:SWEep:ENTRy:DWELI**

This command or query defines the maximum amount of time to wait for the trigger of a sweep entry to occur, after which the trigger is aborted and the next sweep entry, if existed, will run. However, when the required amount of data has been captured before the dwell time has been reached, the sweep engine will move onto the next entry.

Note that, the default dwell time is 0 second, 0 microsecond. This is equivalent to an infinite dwell time. In this case, the sweep engine will move on as soon as the current data capture amount has been met (as explained in the previous paragraph).

When the trigger type is NONE, dwell time is ignored.

<b>Syntax</b>	:SWEep:ENTRy:DWELI <integer>[,<integer>] :SWEep:ENTRy:DWELI?
<b>Parameter</b>	<second>[,<microsecond>]
<b>Allowable Values</b>	0 – 4294967295 (or $2^{32} - 1$ ) 0,0 := infinity
<b>Query Response</b>	<integer>,<integer>
<b>I/O Data Type</b>	Integer   Comma separated integers
<b>*RST State</b>	0,0 (infinite dwell time)
<b>Examples</b>	:SWEEP:ENTR:DWEL 5,30 :SWEEP:ENTR:DWELL 2 :SWEEP:ENTR:DWELL?

## **:SWEep:ENTRy:PPBlock**

This command (where PPBlock is defined as Packets per block) has the same functionality as the :TRACe:BLOCK:PACKets command since at each sweep frequency step of an entry, a block of data can be captured.

Refers to the :TRACe:BLOCK:PACKets section (page [71](#)) for the definition of this command.

**Examples** :SWEEP:ENTR:PPB 10  
:SWEEP:ENTRy:PPB?

## **:SWEep:ENTRy:SPPacket**

Refers to the :TRACe:SPPacket section (page [72](#)) for the definition of this command.

**Examples** :SWEEP:ENTR:SPP 16384  
:SWEEP:ENTRy:SPP?

## **:SWEep:ENTRy:TRIGger:LEVel**

Refers to the :TRIGger:LEVel section (page [69](#)) for the definition of this command.

**Examples** :SWEEP:ENTR:TRIG:LEV 2400 MHZ,2900 MHZ,-60  
:SWEEP:ENTRy:TRIGGER:LEVEL?

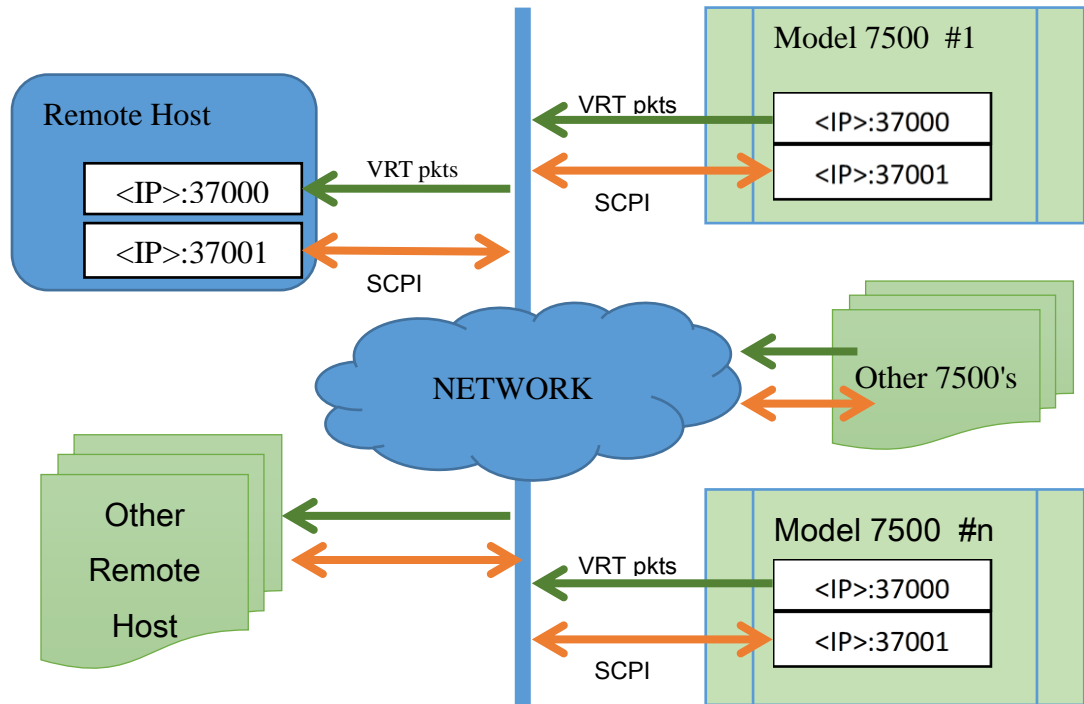

## :SWEep:ENTRy:TRIGger:TYPE

Refers to the :TRIGger:TYPE section (page 69) for the definition of this command.

Examples :SWEEP:ENTR:TRIG:TYPE LEVEL  
:SWEEP:ENTRY:TRIG:TYPE?

## Appendix A: Connecting to RTSA 7500

BNC's RTSA 7500 are network ready devices conveying control commands and data using TCP/IP protocol. Each RTSA 7500 receives SCPI commands and sends query responds over port 37001, and sends VRT context and data packets over port 37000, as illustrated in the following figure:

A RTSA 7500, when powered up, will have a dynamic or preassigned static IP address, which when bind with a port will form a network socket. To successfully establish a connection to a RTSA 7500, **both** <IP>:37000 and <IP>:37001 sockets must be created one right after the other, the order is not important.

In addition, refer to the "Connecting to the RTSA7500" of the *RTSA7500 User Guide (v3.6 or later)* for more information on how to connect to RTSA7500 and to determine its IP address.

# Appendix B: Protocol for Discovering RTSA 7500

BNC uses a simple broadcast UDP protocol for discovering any RTSA 7500's available on the same local network as the host computer. This protocol can not be used to find any RTSA 7500's on a different network.

The remote host computer would first send out a UDP message of broadcast type to port 18331. The message contains a query request code followed by query discovery version in big-endian order as follows:

<request code><discovery version>

where each field is:

Name	Data Type	Length	Required Value
request code	32-bit unsigned integer	1	0x93315555
discovery version	32-bit unsigned integer	1	2

The discovery version is used to determine how to parse the response message. Note that the <> bracket is for clarity of the explanation purpose only, not to be included in the message.

A RTSA 7500 with the discovery version 2 would respond with the following data:

<response code><discovery version><model><serial><firmware version>

where each field is:

Name	Data Type	Length	Response Value
response code	32-bit unsigned integer	1	0x93316666
discovery version	32-bit unsigned integer	1	2
model	ASCII character, nul-padded	16	RTSA7500-XXX (ex: RTSA7500-220)
serial	ASCII character, nul-padded	16	XXXXXX-XXX (ex: 120600-020)
firmware version	ASCII character, nul-padded	20	vX.X.X (ex: v1.0.0)

The IP address of a RTSA 7500 can be retrieved from the responding socket. The RTSA 7500 may be identified by matching the serial number (S/N) in the response message with the S/N on the label of the RTSA 7500.

## Appendix C: SCPI Command Syntax

Each SCPI command consists of a root node, one or more lower level nodes, follow by applicable parameters and separators:

### Entering Commands

SCPI commands have both a long and short version, such as `:SOURCE` and `:SOUR`. The SCPI interface responds to either version, but will not respond to variations of either version. The interface does not differentiate between upper-case and lower-case letters but only the long or short form of a command.

An example correct and incorrect SCPI entry format for `:SOURce` command:

	Command Entry		
<b>Correct Entry</b>	<code>:SOURCE</code>	<code>:SOURce</code>	<code>:source</code>
	<code>:SOUR</code>	<code>:sour</code>	
<b>Incorrect Entry</b>	<code>:SOU</code>	<code>:SOURC</code>	
	<code>:sourc</code>		

**Note:** At the end of each SCPI command string, whether a single command or multiple commands separated by semicolons “;”, a new line-feed or carriage return is required. Example in C: `“:FREQ:CENTER 2400 MHZ\n”` or `“FREQ:CENT 2400 MHZ;INP:ANT 1\n”`.

### Notation

Notation	Description
<code>:</code>	Links command keywords together
<code>;</code>	Separates multiple commands entered together on a single program message
<i>single space</i>	Uses to separate a parameter from a command or unit from a parameter
<code>,</code>	Uses to separate multiples parameters of a command
<code>[]</code>	Uses to optionally enclose zero or more parameters
<code>{.}</code> or <code>{.*}</code>	The enclosed item maybe included zero or more times
<code>{.+}</code>	The enclosed items occurs one or more times

{. . .}	One and only one of the two or more enclosed items separated by   maybe included
<>	Uses to enclose <i>required</i> parameter descriptions
?	Indicates query command, use where applicable
	Indicates “or” and is used to separate alternative parameter options
::=	Means “is defined as”

---

## Parameter types

This section defines different SCPI parameter data type.

Parameter Type	Description
<boolean>	ON   OFF   1   0 Boolean parameters are always returned as 1 or 0 in NR1 format by query commands
<integer>	Unsigned integer of NR1 format
<int>	Ex: 1 or 3432
<NR1>	Signed integer without a decimal point (implied radix point) Ex: -25 or 0
<NR2>	Signed number with an explicit radix point Ex: -1.234 or 1.0 or 0.0
<NR3>	Scaled explicit decimal point numeric value with and an exponent Ex: 2.73e+2 or 2.351e2
<NRf>	<NR1> <NR2> <NR3>
<NRr>	Non-decimal numeric value such as hexadecimal, octal or binary
<char>	Character program data
<character>	Ex: MAXimum or MEDium
<string>	ASCII string surrounded by single or double quotes Ex: “This is an example”

---

## Default Units

Parameter	Default Unit
frequency	Hz
time	s or ns where applicable
voltage	V
absolute amplitude	dBm
relative amplitude	dB

---

Units other than the default may be specified. If units are not specified then the default units apply. Note the following examples, which are all equivalent.

**Example** :FREQ:CENTer 2441.5 MHz  
is equivalent to :FREQ:CENTer 2441500000  
is equivalent to :FREQ:CENTer 2441500000 Hz  
is equivalent to :FREQ:CENTer 244150 kHz  
is equivalent to :FREQ:CENTer 2441.5e6

## Appendix D: SCPI Status and Event Registers

The RTSA 7500's SCPI interface has a status and event reporting system that enables the user to handle device events. The interface conforms to IEEE Std 488.2-1987 and SCPI 1999.0. This section discusses these status registers, status register enable masks, event queues and event handling.

### Status Byte Register (SBR)

The SBR is used to determine the specific nature of the event or condition. It is read by issuing a \*STB? command. The contents of the SBR are clear by issuing either a \*STB? or \*CLS command.

Bits in the SBR will be set only when the corresponding bits in the Service Request Enable Register are set.

Bit	Name	Description
0	not used	This bit is not used and is always 0.
1	not used	This bit is not used and is always 0.
2	Error / Event Available (EAV)	This bit is set if there are any unread error or event in the System Error queue. It is read using the SYSTem:ERRor? query.
3	Questionable Register Summary	This bit is not used and is always 0.
4	Message Available (MAV)	This bit is set if there is any unread data in the Output queue.
5	Standard Event Status Bit (ESB)	This bit is set if there is any unread or non-cleared data in the Standard Event Status register.
6	Request Service	Summary of the Request Service register.
7	Operation Condition Register Summary	Summary of the Operation Status register

### Standard Event Status Register (ESR)

The ESR is used to determine the nature of the status and error conditions. It is read by issuing a \*ESR? command. The contents of the ESR are clear by issuing either a \*ESR? or \*CLS command.

Bits in the ESR will be set only when the corresponding bits in the Standard Events Status Enable Register are set.

Bit	Name	Description
0	Operation Complete (OPC)	Set to indicate that all pending operations are complete and the RTSA7500 is ready to accept another command, or that query results are available.
1	Request Control (RQC)	This bit is not used and is always 0.
2	Query Error (QYE)	Set to indicate that a query has been made for which no response is available. Query errors have SCPI error codes from -499 to -400.

3	Device Dependent Error (DDE)	Set to indicate that a device-dependent error has occurred. Device-dependent errors have SCPI error codes from –399 to –300 and 1 to 32767.
4	Execution Error (E)	Set to indicate that a parameter exceeds its allowed range. Execution errors have SCPI error codes from –299 to –200.
5	Command Error (CME)	Set to indicate that a command error has occurred. Command errors have SCPI error codes from –199 to –100.
6	not used	This bit is always 0.
7	Power ON (PON)	Set once upon power-up. This bit has no effect on the Error / Event Available (EAV) bit in the Status Byte Register.

## Operational Status (OSR) Register

The OSR is a 16-bit register that is used to determine the state of operation. It is read by issuing a `:STATus:OPERation[:EVENT]?` command.

Bit	Name	Description
0-3	not used	These bits are not used and is always 0.
4	Measuring (MEAS)	Set to indicate that a query has been made for which no response is available. Query errors have SCPI error codes from –499 to –400.
5-15	not used	These bits are not used and is always 0.

## Output Queue

The RTSA7500 has an Output FIFO Queue that is structured as a FIFO and holds the response messages to queries. The SBR's MAV bit is set when there are messages in the queue. The unread results of a previous command are cleared from the queue when a new command or query is received.

## Error and Event Queue

The RTSA7500 has an Error and Event FIFO Queue that holds up to 16 errors and events. It is queried using the `:SYSTem:ERRor[:NEXT]?` command. The `*CLS` command clears all entries from the queue.

## Appendix E: SCPI Error Codes Used

Code	Message	Description
0	No error	
<b>Command error, range [-199, -100]</b>		
-144	Character data too long	The character data contained more than 12 characters.
-171	Invalid expression	The command syntax was incorrect.
<b>Execution error, range [-299, -200]</b>		
-200	Execution error	A generic execution error for which more specific information is not available.
-210	Trigger error	
-220	No matched module	The specific operation is not installed.
-221	Settings conflict	Indicates that a legal program data element was parsed but could not be executed due to the current device state
-222	Data out of range	A parameter was of the proper type but outside of the defined range for the specific command.
-223	Too much data	A parameter was received that contained more data than the device could handle.
-224	Illegal parameter value	A parameter was received that is NOT allowed for the particular command.
-230	Data corrupt or stale	Possibly invalid data; new reading started but not completed since last access.
-240	Hardware error	Indicates that a legal program command or query could not be executed because of a hardware problem in the device.
-241	Hardware missing	Indicates that a legal program command or query could not be executed because of missing device hardware.
<b>Device specific error, range [-399, -300]</b>		
-321	Out of memory	An internal operation needed more memory than that was available.
-330	Self test failed	
-340	Calibration failed	
-350	Query overflow	The SCPI remote interface error queue overflowed.
<b>Query error, range [-499, -400]</b>		
-410	Query INTERRUPTED	A condition causing an INTERRUPTED query error occurred
<b>RTSA7500 Specific, range [-999, -900]</b>		
-901	No data	Read trace command issued while there is no data available.
-911	Please upgrade firmware	The current firmware needs upgrading.
-912	Invalid option license	The option could not be installed because of invalid license.

## Appendix F: SCPI Commands Quick Reference

This section summarizes the SCPI commands available for interfacing with RTSA7500. The commands are listed alphabetically based on the main node, then sub-nodes, so on. The sub-nodes are grouped and listed alphabetically based on functionality.

See [Appendix C](#)'s Notation section for details on notations used in the Parameter column.

The Release column indicates from which **firmware** release version that the commands are available. **Grayed-out** commands are not yet implemented.

Keyword	Parameter	Description	Release
<b>IEEE Mandated</b>		<i>Page 43</i>	
*CLS		Clear all status registers	v1.0
*ESE	<integer>	Event Status Enable register	v1.0
*ESE?		Query ESE register	v1.0
*ESR?		Query Event Status Register	v1.0
*IDN?		Query device identification	v1.0
*OPC		Operation Complete	TBD
*OPC?		Query OC	TBD
*RST		Reset to factory default	v1.0
*SRE	<integer>	Service Request Enable bits	v1.0
*SRE?		Query SRE register	v1.0
*STB?		Query Status Byte register	v1.0
*TST?		Query self-test status	v1.0
*WAI		Wait-to-Continue	TBD
<b>:INPut</b>		<i>Page 59</i>	
:ATTenuator	ON   OFF   1   0	Enables/disables the front-end's 20dB attenuation (on some models)	v3.0
:ATTenuator?			
:VARIable	<integer [dB]>	Sets the variable attenuation for RTSA7500-418 and -427	v4.3.8
:VARIable?			
:FILTer			
:PRESelect	ON   OFF   1   0	Enables/disables the use of preselect filtering	TBD
:PRESelect?			
:GAIN	<index> <ON   OFF   1   0>	Sets an input gain stage to be on or off. The index range is model dependent.	v4.5.0
:GAIN?	<index>		
:IF	<NR1 [unit]>	Selects the variable IF gain stages	TBD
:IF?			
:HDR		Sets gain level for the narrow-band ADC of the HDR signal path	v3.1 – :NB v3.2.1 – :HDR
:HDR?	[MAX   MIN]		

Keyword	Parameter	Description	Release
:MODE	ZIF   DD   HDR   IQIN   SH   SHN   HIF	Selects the receiver mode of operation. See the complete command description section for special notes.	v3.0 – ZIF v3.1 – HDR v3.2 – SH v3.2.1 – IQIN, SHN v3.2.2 – DD v3.5.0 – HIF
:MODE?			
<b>:OUTput</b>		<i>Page 67</i>	
:IQ			
:MODE	CONNector   DIGitizer	Selects the IQ output path type	v3.1
:MODE?			
:CONNector			
:INVersion?	[NRf [unit]]	Query if spectral inversion is required at the given frequency	v4.1.0
<b>[:SENSe]</b>		<i>Page 63</i>	
:CORRection			
:DCOFset	ON   OFF   1   0	Enables/disables the wideband ADC's DC-offset correction	TBD
:DCOFset?			
:DECimation	OFF   <integer>	Sets the decimation rate as an exponent of 2 (i.e rate = 2 <sup>level</sup> where level = 0, 1, 2 - 10)	v3.0
:DECimation?	[MAX   MIN]		
:FREQuency			
:CENTer	<NRf [unit]>	Sets the center frequency of the RFE	v3.0
:CENTer?	[MAX   MIN]		
:IF?	<non-zero integer>	Queries the IF frequencies that are used for the current input mode and center frequency	v4.3.2
:LOSCillator?	<1   2>	Gets the frequency to be set for the external LO 1 or 2 in corresponding to current the RTSA 7500's center frequency	v3.2.1
:SHIFt	<NRf [unit]>	Sets the frequency shift value (not available for HDR mode)	v3.1
:SHIFt?	[MAX   MIN]		v3.1
:RESolution?		Gets the Analog PLL tuning resolution	TBD
:INVersion?	<NRf [unit]>	<del>Query if a spectral inversion is required at the given frequency</del>	<del>v3.2.3</del> v4.1.0 - Deprecated
:LOCK			
:REFerence?		Queries the lock status of the PLL reference clock	v3.0
:RF?		Queries the lock status of the RFE's RF PLL	v3.0
<b>:SOURce</b>		<i>Page 63</i>	
:REFerence			
:PLL	INT   EXT	Selects the 10MHz reference clock source	v3.0
:PLL?			
:RESET		Resets the 10MHz reference selection to INTERNAL source	v3.0
<b>:STATus</b>		<i>Page 56</i>	

Keyword	Parameter	Description	Release
:OPERation		Returns the standard Operation Status Register (OSR) for any event	
[:EVENT]?			TBD
:CONDition?			TBD
:ENABle	<integer>		v3.0
:ENABle?			
:PRESET		Presets the RTSA7500 (similar to *RST)	v3.0
:QUESTionable		Returns the standard Questionable Status Register (QSR) for any event	
[:EVENT]?			TBD
:CONDition?			TBD
:ENABle	<integer>		v3.0
:ENABle?			
:TEMPerature?		Returns the RTSA7500's internal ambient temperature	v3.2.1
<hr/>			
<b>:SWEep</b>		<i>Page 73</i>	
:LIST			
:ITERations	<integer>	Defines the number of times the list is repeated during execution	v3.1
:ITERations?			v3.1
:START	[integer]	Begins execution of the current sweep list from the first entry	v3.1
:STATus?			v3.1
:STOP		Stops execution of the current sweep list	v3.1
:ENTRy			
:COpy	<integer>	Copies the settings of an existing sweep entry into the current settings for quick editing	v3.1
:COUNt?		Gets the number of entries available in the list	v3.1
:DELETE	<integer>   ALL	Deletes a specified entry or all entries	v3.1
:NEw		Sets the sweep entry's capture configuration settings to default values	v3.1
:READ?	<integer>	Gets the settings of an existing sweep entry	v3.1
:SAVE	[integer]	Saves the current editing entry to the end of the list or before the specified ID location in the list when the integer value is given	v3.1
:ATTenuator	As defined in :INPut:ATTenuator, page 59		v3.1
:ATTenuator?			
:DECimation	As defined in [:SENSE]:DECimation, page 64		v3.0
:DECimation?			
:FILTer			
:PRESelect	As defined in :INPut:FILTer:PRESelect, page 60		TBD
:PRESelect?			
:FREQUency			
:CENTer	<NRf [unit]>[,<NRf [unit]>] ::= <start freq>[,<stop freq>]	Sets the center frequency or a range of center frequencies that are stepped by the value defined by :SWEep:ENTRy:FREQUency:STEP	v3.0

Keyword	Parameter	Description	Release
:CENTer?			
:SHIFt	As defined in [:SENSE]:FREQuency:SHIFt, page 66		v3.1
:SHIFt?			v3.1
:STEP	<NRf [unit]>	Sets the amount of frequency that the center frequency is stepped by	v3.0
:STEP?			v3.0
:GAIN			
:IF	As defined in :INPut:GAIN:IF, page 61		TBD
:IF?			
:HDR	As defined in :INPut:GAIN:HDR, page 61		v3.1 – :NB
:HDR?			v3.2.1 – :HDR
:MODE	As defined in :INPut:MODE, page 62		v3.1
:MODE?			v3.1
:DWELI	<integer>[,<integer>] ::= <sec>[,<microsec>]	Sets the maximum amount of time to wait for the trigger of a sweep entry to occur, after which the trigger is aborted and the next sweep entry if existed will run. When the trigger type is NONE, dwell time is ignored. Default 0.0 sec.	v3.0
:DWELI?			
:PPBlock	Same as :TRACe:BLOCK:PACKets, page 71		v3.0
:PPBlock?			
:SPPacket	As defined in :TRACe:SPPacket, page 72		v3.0
:SPPacket?			
:TRIGger			
:LEVel	As defined in :TRIGger:LEVel, page 69		v4.1.0
:LEVel?			
:TYPE	As defined in :TRIGger:TYPE, page 69		v3.1.2 – PULSE   NONE
:TYPE?			v3.2.0 – WORD
<b>:SYSTem</b>		<i>Page 46</i>	
:ABORt		Aborts the current data capturing process and puts the RTSA 7500 system into a normal manual mode (i.e. sweep, trigger, and streaming will be aborted)	v3.0
:CAPability?		Returns a list of the RTSA7500's firmware and hardware capability	TBD
:CAPTure			
:MODE?		Gets the current capture mode of the RTSA 7500 (i.e. sweeping, streaming or block mode)	v3.0
:COMMunicate			
:LAN			
:APPLy		Apply the new RTSA 7500's LAN settings from the commands above, which will then take effect. This command should be applied only once all the required LAN settings have been set.	v3.2.3
:CONFIgure	DHCP   STATIC	Set the RTSA 7500's LAN to use DHCP or STATIC configuration type	v3.2.3

Keyword	Parameter	Description	Release
:CONFigure?	[CURRENT]		v3.2.3
:DNS	<main DNS>[,alt DNS]	Set the RTSA 7500's LAN DNS address(es)	v3.2.3
:DNS?	[CURRENT]		v3.2.3
:GATEway	<IPv4 address>	Set the RTSA 7500's LAN Gateway address	v3.2.3
:GATEway?	[CURRENT]		v3.2.3
:IP	<IPv4 address>	Set the new IPv4 address for the RTSA 7500's LAN	v3.2.3
:IP?	[CURRENT]		v3.2.3
:NETMask	<IPv4 address>	Set the RTSA 7500's LAN netmask address	v3.2.3
:NETMask?	[CURRENT]		v3.2.3
:ERRor			v1.0
[:NEXT]?		Returns the SCPI error/event queue	v1.0
:ALL?		Returns all the errors in the queue	TBD
:FLUSH		Clears the RTSA7500's internal data storage buffer of any remaining old data that has not been transferred out of the RTSA 7500.	v3.0
:LOCK			
:HAVE?	ACQuisition	Returns the current lock state of the task specified	v3.0
:REQuest?	ACQuisition	Request the RTSA7500 to provide a lock on a specific task such that only the application that has the lock can perform the task	v3.0
:OPTions?		Returns comma separated 3-digit values to represent the hardware option(s) or features available with a particular RTSA 7500 model	v3.2.1
:SYNC			
:MASter	ON   OFF   1   0	Sets a RTSA 7500 unit to be the master or slave for a synchronization trigger system with multiple units. Affects :TRIG:TYPE PULSe or WORD	v3.1.2
:MASter?			
:WAIT	<integer>	Sets the delay time in nanoseconds that the system must wait after receiving the trigger signal before performing data capture	v3.1.2
:WAIT?			
:VERSion?		Returns the SCPI compliance version	v3.0
:DATE	<integer>,<integer>,<integer> ::= <year>,<month>,<date>	Sets the date	TBD
:DATE?			TBD
:TIME	<integer>,<integer>,<integer> [,<integer>]   <char> ::= <hr>,<min>,<s>[,<ms>]	Sets the time	TBD
:ADJust	<integer>	Adjust the system time relative to it's current time	
:MODE		Synchronize one time only or continuously	
:MODE?			
:SYNC	DISable   NTP,{ONCE   CONTInuous}	Selects the synchronization source and mode	
:SYNC?			
:STATus?		Returns the status of the time synchronization	
:TIME?			v3.2.1

Keyword	Parameter	Description	Release
<b>:TRACe</b>		<i>Page 70</i>	
:BLOCk			
:DATA?		Initiates the sending of the IQ data captured	v3.0
:PACKets	<integer>	Sets the number of IQ data packets to be captured per block (a block = :PACKets * SPP)	v3.0
:PACKets?	[MAX   MIN]		
:SPPacket	<integer>	Defines the number of IQ samples per VRT packet, and must be a multiple of 16	v3.0
:SPPacket?	[MAX   MIN]		
:STReam			
:START	[integer]	Initiates the capture, storage and streaming of IQ data	v3.1
:STOP		Stops streaming	v3.1
<b>:TRIGger</b>		<i>Page 69</i>	
:LEVel	<NRf [unit],<NRf[unit],<NRf [unit]> ::= <start>,<stop>,<level>	Sets the frequency range and amplitude of a frequency domain level trigger	v4.1.0
:LEVel?			
:PERiodic	<integer [unit]>	Sets the time period of a periodic trigger	TBD
:PERiodic?			
:STATus?		Returns the status of the active trigger as to whether it is pending or has occurred	TBD
:TYPE	LEVel   PERiodic   PULSe   WORD   NONE	Sets or disables the trigger type	v3.1.2 – PULSE   WORD   NONE
:TYPE?

## Document Revision History

This section summarizes document revision history.

Document Version <sup>1</sup>	Release Date	Revisions and Notes
v2.0 – v2.5	May.2012 – March.2013	<ul style="list-style-type: none"> <li>- First release of this document for RTSA 7500</li> <li>- Modified Stream and Trigger commands</li> <li>- Added details to the Sweep section for single list sweep and synchronized sweep with external trigger</li> <li>- Added :SYSTem:LOCK command subset and note on mandatory command :SYSTem:LOCK:REQuest? ACQuisition for starting data acquisition</li> <li>- Added :SYSTem:ABORt and :SYSTem:FLUSh with caution note</li> <li>- Added VRT Extension context packet class 0x90000004 with a custom context packet defined for sweep start Ids</li> </ul>
v2.6	March.11.2013	<ul style="list-style-type: none"> <li>- SPPacket value is now limited to be a multiple of 16 only with range within 128 to (2<sup>16</sup> – 16) inclusive</li> <li>- Added :SYSTem:CAPTure:MODE?</li> </ul>
v2.7	August.20.2013	<ul style="list-style-type: none"> <li>Removed the note on IF gain change settling time. It is no longer applicable as the issue is resolved.</li> </ul>
v3.0	September.03.2013	<ul style="list-style-type: none"> <li>- Updated this document to correspond with the capabilities of RTSA7500. Contact Support for list of changes from RTSA 7500 to RTSA7500.</li> </ul>
v3.1	October.01.2013	<ul style="list-style-type: none"> <li>- Added: <ul style="list-style-type: none"> <li>+ :OUTput:IQ:MODE command</li> <li>+ <a href="#">Table 8</a> to list the different VRT Stream Ids</li> <li>+ Stream IDs to <a href="#">Table 28</a> (was Table 27)</li> <li>+ <a href="#">Table 35</a> to list the conditions leading to VRT trailer's indicator abnormal state and resolution suggestions</li> <li>+ Appendix A: Connecting to RTSA 7500 and Appendix B: Protocol for Discovering RTSA 7500</li> </ul> </li> <li>- Made available: <ul style="list-style-type: none"> <li>+ :INPut:GAIN:HDR command</li> <li>+ :INPut:MODE and :SWEep:ENTRy:MODE command</li> <li>+ Stream feature (see <a href="#">Table 5</a> for available commands)</li> <li>+ Sweep feature (see <a href="#">Table 6</a> for available commands)</li> <li>+ Over-range indicator in the Trailer word</li> </ul> </li> <li>- Deprecated: <ul style="list-style-type: none"> <li>+ :TRIGger:SYNC and :SWEep:LIST:TRIGger:SYNC (replaced with :SYSTem:SYNC:MASter)</li> <li>+ :TRIGger:DELay and :SWEep:LIST:TRIGger:DELay (replaced with :SYSTem:SYNC:WAIT)</li> </ul> </li> <li>- Changed SYSTem:FTUNe back to [:SENSe]:FREQUency:SHIFt and :SWEep:ENTRy:FREQUency:SHIFt as it was originally. And corrected the allowable range to be -62.5MHz to 62.5MHz</li> </ul>

Document Version <sup>1</sup>	Release Date	Revisions and Notes
		<ul style="list-style-type: none"> <li>- Changed <a href="#">Figure 11</a> and <a href="#">12</a></li> <li>- Updated :TRACe:SPPacket definition and <a href="#">Table 37</a> (was Table 35)</li> </ul>
v3.1.1	December.01.2013	<ul style="list-style-type: none"> <li>- Corrected :SWEep:ENTRy:READ? output response field</li> <li>- Made available the decimation rate of 1024</li> </ul>
v3.1.2	December.20.2013	<ul style="list-style-type: none"> <li>- Made available: <ul style="list-style-type: none"> <li>+ :SYSTem:SYNC:MASTer and :SYSTem:SYNC:WAIT</li> <li>+ :TRIGger:TYPE and :SWEep:ENTRy:TRIGger:TYPE</li> </ul> </li> </ul> <p>commands for the PULSE   NONE modes only</p>
v3.1.3	January.10.2014	<ul style="list-style-type: none"> <li>- Updated the explanation for [:SENSe]:DECimation</li> <li>- Made available WORD mode for :TRIGger:TYPE and :SWEep:ENTRy:TRIGger:TYPE</li> </ul>
v3.2.0	January.30.2014	<ul style="list-style-type: none"> <li>- Made available SH mode for :INPut:MODE and updated the IBW from 40MHz to 30MHz</li> <li>- Added to VRT's Trailer Word Format section a new Spectral Inversion Indicator bit that is used with SH mode</li> <li>- Added important notes for :OUTput:IQ:MODE CONNector usage</li> </ul>
v3.2.1	February.28.2014	<ul style="list-style-type: none"> <li>- Made available :SWEep:ENTRy:TRIGger:TYPE WORD</li> <li>- Enabled IQIN option for :INPut:MODE command</li> <li>- Clarified the IQ<sub>measured</sub> parameter in the VRT's Reference Level section</li> <li>- *RST value for :INPut:GAIN:NB is changed from 0 to -10dB</li> </ul>
v3.2.2	April.14.2014	<ul style="list-style-type: none"> <li>- Enabled :STATus:TEMPerature? and :SYSTem:TIME?query only commands</li> <li>- Added: <ul style="list-style-type: none"> <li>+ New commands :SYSTem:OPTions? and [:SENSe]:FREQuency:LOSCillator? to support RTSA 7500s with the external local oscillator mode</li> <li>+ &lt;HDR gain&gt; field to :SWEep:ENTRy:READ? returned string, right after &lt;IF gain&gt;</li> <li>+ SHN mode to :INPut:MODE and :SWEep:ENTRy:MODE, as well as in <a href="#">Table 2</a></li> <li>+ New details/definition to [:SENSe]:DECimation command</li> <li>+ A note to :SOURce:REFerence:PLL to see a related AppNote</li> <li>+ New notes under <a href="#">Table 2</a> regarding the IBW of the SH and SHN modes</li> </ul> </li> <li>- Changed: <ul style="list-style-type: none"> <li>+ :INPut:GAIN:NB to :INPut:GAIN:HDR for consistency</li> <li>+ The <b>Important Notes</b> relating to :OUTput:IQ:MODE CONNector mode. Data capture through :TRACe commands is no longer available and the spectral inversion indicator for SH or SHN mode is now available through GPIO port</li> <li>+ :PRESet keyword to :PRESET to avoid conflict with the :PRESelect keyword</li> <li>+ :DELeTe to :DELETE to avoid conflict with :DELay</li> <li>+ :RESet to :RESET to avoid conflict with :RESume</li> </ul> </li> <li>- Removed the following commands as they are unnecessary</li> </ul>

Document Version <sup>1</sup>	Release Date	Revisions and Notes
		<ul style="list-style-type: none"> <li>+ :SWEep:LIST:RESume</li> <li>+ :INPut:FILTer:SAW</li> </ul>
v3.2.3	May.01.2014	<ul style="list-style-type: none"> <li>- Changed maximum SPP for all RFE modes to 65520</li> <li>- Added a note to <a href="#">Table 36</a> of :SYSTem:OPTions? regarding external local oscillator option only available to specific RTSA7500 variant</li> <li>- Enabled RFE's DD mode available for package release v3.2.2</li> </ul>
v3.2.4	May.19.2014	<ul style="list-style-type: none"> <li>- Added <ul style="list-style-type: none"> <li>+ :SYSTem:COMMunicate:LAN:CONFigure and others LAN commands to change the RTSA 7500 LAN settings</li> <li>+ [:SENSe]:FREQuency:INVersion? command for determining when spectral inversion is required for a given frequency</li> <li>+ New notes to <a href="#">Table 2</a>, :INPut:MODE, and :OUTput:IQ:MODE regarding RFE mode availability due to product model dependency</li> </ul> </li> </ul>
v3.2.5	June.06.2014	<ul style="list-style-type: none"> <li>- Added USB console control connection and some correction to <a href="#">Figure 2</a></li> <li>- New note to <a href="#">Table 2</a> regarding SH/SHN modes and the decimation usage</li> </ul>
v3.2.6	June.10.2014	<ul style="list-style-type: none"> <li>- Corrected the tuning resolution for HDR to be 100kHz</li> </ul>
v3.3.0	July.21.2014	<ul style="list-style-type: none"> <li>- Data output type for SH/SHN mode with Decimation will now be I and Q. See <a href="#">Table 2</a> for details.</li> <li>- Replace [:SENSe]:FREQuency:INVersion? With :OUTput:IQ:CONNector:INVersion?</li> <li>- Enable frequency level trigger command :TRIGger:LEVel</li> <li>- Caution note for using external 10MHz refence source in the :SOURce:REFerence:PLL command</li> </ul>
v3.3.1	Aug.11.2014	<ul style="list-style-type: none"> <li>- Corrected the equation for calculating the absolute power level in the <b>Reference Level</b> section</li> <li>- Corrected the level parameter in :TRIGger:LEVel to be a signed integer type instead of double</li> <li>- Added limitation to the maximum allowable trigger level for the <b>Frequency Domain Triggering</b> basing on the attenuation setting; and removed the mentioning of the dependency on the gain settings.</li> </ul>
v3.3.2	Oct.15.2014	<ul style="list-style-type: none"> <li>- Corrected :TRIGger:STATus? to be unavailable</li> <li>- Corrected the absolute power level formula in the <b>Reference Level</b> section</li> <li>- Updated the <b>Conventions</b> section with the meaning of different fonts used in the document</li> </ul>
v3.3.3	Nov.17.2014	<ul style="list-style-type: none"> <li>- Added notes regarding IQIN mode not available in product version 2.2</li> </ul>
v3.4.0	Nov.26.2014	<ul style="list-style-type: none"> <li>- Corrected frequency tuning information regarding DD and IQIN mode as well as the data output for DD mode in <a href="#">Table 2</a> and [:SENSe]:FREQuency:CENTer</li> <li>- Changed HDR maximum gain to 34 and default to 25 for the :INPut:GAIN:HDR command</li> <li>- Clarified the definition of maximum value for :TRACe:SPPacket, especially with I<sub>14</sub> format</li> <li>- Corrected the optional [:DATA] part of the :TRACe:BLOCK:DATA? command to be non-optional</li> </ul>

Document Version <sup>1</sup>	Release Date	Revisions and Notes
		<ul style="list-style-type: none"> <li>- Reorganized alphabetically some commands within groups of specific function across the document</li> <li>- Removed PSD data output feature and all references to PSD</li> <li>- Removed the whole :CALibrate section</li> </ul>
<b>v3.4.1</b>	Jan.26.2015	<ul style="list-style-type: none"> <li>- Minor correction to :TRACe:SPPacket and <a href="#">Appendix C</a> sections</li> </ul>
<b>v3.5.0</b>	Feb.16.2015	<ul style="list-style-type: none"> <li>- Added support for RTSA7500-XXX-HIF model (code 002 for :SYSTem:OPTions? and :INPut:MODE[?] HIF)</li> <li>- Added the new command [:SENSe]:FREQUency:IF? for determining the IF frequencies used for the current input mode and center frequency</li> </ul>
<b>v3.5.1</b>	Jun.10.2015	<ul style="list-style-type: none"> <li>- Added :INPut:ATTenuator:VARiable[?] command for RTSA7500-418 and -427 models only and a note to indicate :INPut:ATTenuator[?] command is not available for -418 and -427 models</li> <li>- Consistency clean up for some SCPI commands</li> </ul>
<b>v3.6.0</b>	Jan.15.2016	<ul style="list-style-type: none"> <li>- Added: <ul style="list-style-type: none"> <li>+ WBIQ and P values to :SYSTem:OPTions? command</li> <li>+ a note in *IDN? regarding the model string returned</li> <li>+ a new extension context indicator called <b>IQ Swapped Indicator</b></li> </ul> </li> </ul>
<b>v3.6.1</b>	April.1.2016	<ul style="list-style-type: none"> <li>- Added: <ul style="list-style-type: none"> <li>+ more local oscillator values and corrected the example in [:SENSe]:FREQUency:LOSCillator?</li> <li>+ information on WBIQ model to <a href="#">Table 2</a>, [:SENSe]:DECimation and :SYSTem:OPTions?</li> <li>+ support or not note on -408P model in :INPut:ATTenuator:VARiable and :INPut:ATTenuator, respectively</li> <li>+ :INPut:GAIN command</li> </ul> </li> </ul>
<b>v3.6.2</b>	Aug.2.2016	<ul style="list-style-type: none"> <li>- Corrected the PLL tuning resolution for a frequency to be 10Hz in all RFE modes</li> <li>- Changed :TRACe:SPPacket boundary limits to 256 - 65504 samples per VRT packet and required multiples to 32 samples</li> </ul>

<sup>1</sup> Document Version is not the same as the firmware release version as mentioned in Appendix F: SCPI Commands Quick Reference.
