## Tool Testing and Buyoff

Please note that all tools need to be tested and calibrated at Fancort using the exact same parts that you will process in the tools. This is critical so we can calibrate the form and foot position to meet your scope of work. Most tools will need 3-4 samples for testing and these will be returned to you when we ship the tool back. Some parts will be good, and some will not be good. Fancort will also supply a certificate of compliance with the tool, showing that it meets your specification. If you want the parts returned in a pristine condition, please return a shipping tray to us. These trays can be purchased on our website under the link "Production Aids."
