

General Description

The CO4011B is a low cost, high performance Single Chip solution for CANopen remote I/O modules and especially designed for automotive and industrial applications. The device offers the complex implementation of the CANopen standards DS301 and DS401 in a single chip. It is suitable for simple low cost applications like sensor interfacing as well as for complex I/O systems.

CO4011B provides up to 32 digital I/O lines, 0, 4 or 8 channels may be set for analog input operation with a resolution of 8 or 10 bit. To support output overload monitoring, a special error interrupt input is provided. All usual baud rates up to 1 MBit are supported.

The CO4011B Chip requires only few external components, just like a crystal, a CAN transceiver and capacitors. To minimize external interface recommendations all output pins have high current drive capability of 4 mA. For interfacing optoisolators no external drivers are required.

A special interrupt feature for the first 8 digital input pins allows high speed reaction on input changes.

Features

- Single Chip CANopen Controller
- According to CiA Draft Standards DS301 Version 4.0 and DS401 Version 2.0
- Baudrate up to 1MBit
- Various I/O configurations
- Internal noise filtering for all inputs with individual setting for each channel
- Error interrupt input for output overload monitoring
- Output drivers with 4mA
- Watchdog output
- Temperature ranges up to -40 to 105 °C
- Package QFP64

Applications

The CO4011B CANopen Controller is optimised for automotive and industrial applications such as:

- Remote I/O Modules for CANopen
- CANopen Interface for keyboards and control panels
- Low Cost CANopen Interface for sensors like photoelectric reflex switches photo interrupters
- Low Cost CANopen Interface for actors like pneumatic valves, warning panels etc.

CANopen Features

- 2 Transmit- and 1 Receive PDOs
- Dynamic PDO mapping
- Variable PDO identifier
- All CANopen specific PDO transmission types supported:
synchronous, asynchronous, event driven, cyclic, acyclic and remote frame dependent.
- Event timer and inhibit timer features for all transmit PDOs.
- Storing and restoring of object dictionary to non-volatile memory
- Nodeguarding
- Lifeguarding
- Heartbeat
- Emergency messages
- Minimum boot up

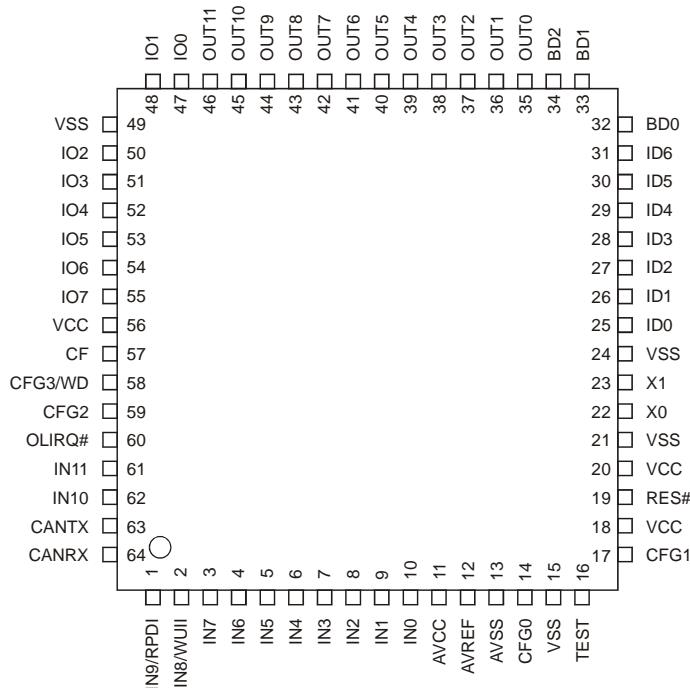

Ordering Information

CO4011B Chip (programmed, licence included)

Part	Temp. Range	Package
CO4011B-FL	-40 °C to 85 °C	QFP64
CO4011BE-FL	-40 °C to 105 °C	QFP64

Software licence

Part	Description
CO4011BSRL-F	Software runtime licence for Fujitsu MB90F497 controller

Pin Assignment**Pin Listing continued**

Pin No.	Pin Name	Funktion
25*, 26*, 27 to 31	ID0*, ID1* ID2 to ID6	Identifier selection input
32 to 34	BD0 to BD2	Baud rate selection input
35 to 46	OUT0 to OUT11	Digital output active low
47, 48, 50 to 55	IO0 to IO7	Digital input or output according to configuration setting. Active low
57	CF	Filter capacitor
60*	OLIRQ# *	Output overload interrupt input active low
61, 62*	IN11, IN10*	Digital input
63	CANTX	Transmitter output of CAN module
64	CANRX	Receiver input of CAN module
15, 21*, 24, 49	VSS	Ground
18*, 20, 56	VCC	Power supply

* Pins may be used for in circuit programming. See "in circuit programming manual" for further information

Pin Listing

Pin No.	Pin Name	Funktion
1 to 2	IN9 to IN8	Digital input active low IN8 additional feature: Wake Up Interrupt Input IN9 additional feature: Reset Power Down Input
3 to 10	IN7 to IN0	Analog or digital input according to setting of CFG0 .. CFG3 active low
11	AVCC	Supply for A/D-Converter
12	AVREF	Reference Voltage for A/D-Converter
13	AVSS	Ground for A/D-Converter
14, 17, 59	CFG0 to CFG2	Configuration bits 0 to 2 for I/O setting / LED output
58	CFG3	Enable additional CAN features input and watchdog output
16	TEST	Do not connect this pin
19	RES#	Reset input active low
22	X0	Crystal oscillator input
23	X1	Crystal oscillator output

Handling the Device**Preventing latch up**

The CO4011B is a CMOS device and may suffer latch up under the following conditions:

- 1) A voltage higher than VCC or lower than VSS is applied to any pin.
- 2) Absolute maximum ratings are exceeded
- 3) AVCC power is provided before VCC supply

Handling unused Pins

Do not leave unused input pins open. This might cause malfunction of the device.

Power Supply Pins

Make sure that all ground and power supply pins are connected to the same potential. Do not leave any ground or power pins open. Connect at least two ceramic capacitors of 100 nF and a tantalum capacitor of 1 uF between VCC and VSS as close as possible to the device.

Power Supply for A/D converter

The power supply for the A/D converter must not be turned on before the power supply VCC. If the A/D converter is not used, connect the pins as follows: AVCC = AVREF = VCC, AVSS = VSS.

Input / output pins

All input and output pins for digital signals are active low. This means for input pins, that inverted pin level is mapped to PDO. For output pins the inverted byte value from received PDO is written to the output pins. Additional inverting capabilities are supported.

Pull up/down resistors

The CO4011B does not support internal pull up/down resistors. Use external components where needed.

Pin Description

All input / output pins are high impedance during reset. The CO4011B does not support internal pull up/down resistors. Use external components where needed. All input pins have Schmitt trigger characteristics. See chapter "Typical Applications" for additional information.

IN0 to IN11: Digital or analog input pins

The function of IN0 to IN7 depends on setting of configuration bits CFG0 to CFG2. See also chapter "Mapping I/O to Object Dictionary" for details.

Note: *Digital input pins are active low. This means that digital input pins are mapped with inverted values to transmit PDO data.*

All digital inputs use internal Schmitt trigger circuits. The CO4011B provides optional input inverters and internal noise filtering for all inputs with individual setting for each channel. See chapter "Object Dictionary" for details.

OUT0 to OUT12: Digital output pins

All output pins have high current drive capabilities of approximate 4 mA for direct interfacing for optocouplers without additional drivers.

Note: *Digital output pins are active low. This means that received output data from PDO is written with inverted values to output pins.*

The CO4011B provides optional output inverters with individual setting for each channel. See chapter "Object Dictionary" for details.

IO0 to IO7: Digital input or output pins

The function of IO0 to IO7 depends on the setting of CFG2. See also chapters "Device Configuration" and "Mapping I/O to Object Dictionary" for details.

For IOx the description of INx or OUTx is valid, dependant to CFG2 setting.

CF: Filter Capacitor input

For correct operation of the CO4011B a ceramic capacitor of 100 nF or 220 nF must be connected between Pin 57 (CF) and VSS. Place this component as close as possible to the CO4011B.

X0, X1: Crystal oscillator input

Connect a crystal of 4 MHz between X0 and X1. Use additional ceramic capacitors of 22 pF between X0 and X1 to VSS.

TEST: Reserved pin

Leave pin TEST unconnected.

OLIRQ#: Output Overload Interrupt

This active low input pin is provided to support output overload monitoring. Connect output from output overload control circuit to this input pin. If the CO4011B scans a low level on pin OLIRQ#, the device automatically enters the error state given in Object 1029.02 (default enter preoperational state). Further more the Error Register (index 1001) is set to 0x03, indicating a current error.

Last but not least the device will send an emergency telegram with error code 0x2310 indicating an overload error.

If output overload monitoring is not to be used in your application, make sure, that pin OLIRQ# is forced to logic high level.

VCC, AVCC, VSS, AVSS: Power Supply Pins

Make sure that all ground and power supply pins are connected to the same potential. Do not leave any ground or power supply pins open. Connect decoupling capacitors as close as possible to the device. See chapter "Recommended Operation Conditions" for details

RES#: Reset input pin

For a correct device reset, provide an active low reset signal according to recommended operation conditions to input RES#.

CFG0 to CFG2: Configuration input pins / LED output pins

Set device configuration to preferred operation mode using CFG0 to CFG3. Leaving any configuration input unconnected may cause malfunction of the device. It is strongly recommended forcing all configuration input bits to either high or low level by using external pull up/down resistors. Do not use direct connection to VCC or VSS.

LED-Functions (active low):

- | | |
|------|--|
| CFG0 | Chip-Status LED shows the Chip status
Always blinking:
10 % Duty cycle indicates no error
50 % Duty cycle indicates uncritical error or warning (no NMT state change outputs not in error condition)
90 % Duty cycle indicates critical error (NMT state change or outputs in error condition) |
| CFG1 | CANopen RUN LED shows NMT state according to DRP303-3 |
| CFG2 | CANopen Error LED shows Error state according to DRP303-3 |

Note: CFGx are input pins during start up and output pins in normal operation mode. In order to prevent short circuit overload a series resistor between CFGx and configuration device (example DIP switch) should be used. See also "typical application" for details.

CFG3/WD: Configuration input / watchdog output

CFG3/WD is scanned during reset to switch the CO4011B to enable additional CAN features. Then CFG3/WD is switched to output and drives the watchdog trigger. To monitor correct device operation, this feature may be used in combination with an external watchdog timer.

Note: CFGx are input pins during start up and output pins in normal operation mode. In order to prevent short circuit overload a series resistor between CFGx and configuration device (example DIP switch) should be used. See also "typical application" for details.

CANRX, CANTX: CAN interface pins

The CAN interface pins may be used for direct connection to CAN transceivers like the 80C251. For longer bus length or noisy or disturbed environments it is strongly recommended to use galvanic isolation with optocouplers between bus interface and CANopen application, to improve system reliability.

Setting of Output Pins

Due to the fact that the firmware cannot set all output pins at the same time, the user must take care, that the output setting sequence does not conflict with the application requirements. In most applications like I/O systems the output setting sequence is completely uncritical.

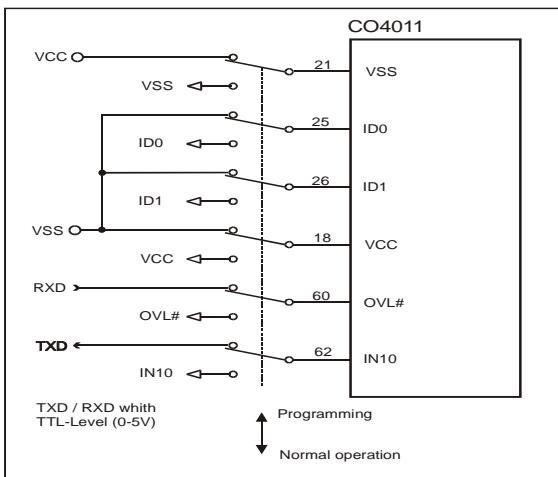

The output pins are modified in the following sequence:

First the output pins OUT0 to OUT5 are set at the same time. The remaining output pins are set in ascending order OUT6 .. OUT11, IO0 .. IO7 one after the other.

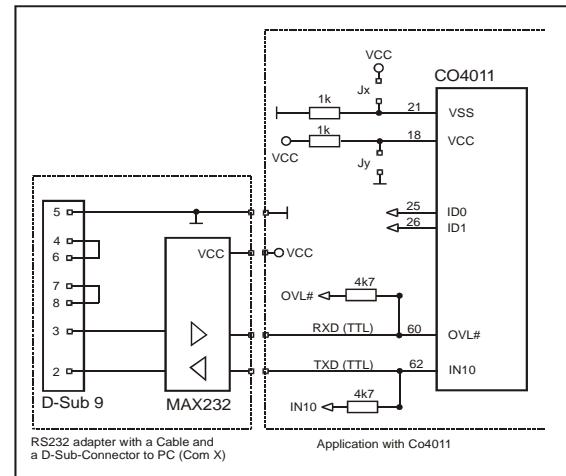

The complete output setting sequence will take only few micro seconds.

In Circuit programming of MB90F497

If you want to enable in circuit programming of the Fujitsu MB90F497 micro controller for CO4011B software download or update, the following conditions must be met.

Design example for programming adaptor.

To enable the programming condition chose an identifier that forces the Pins ID0 and ID1 to low level. For example identifiers ID= 3, 7, 0x0B, 0xF ... might be used. Close the jumpers Jx and Jy.

For optimised programming adapter design, the programming adapter should close the jumpers Jx and Jy directly by plugging the adaptor into the application board.

For normal operation mode the programming adapter must be removed.

Pin No.	Pin Name	Pin Setting for in circuit programming
21	VSS	Level = High
18	VCC	Level = Low
25	ID0	Level = Low
26	ID1	Level = Low
60	OVL#	RXD (TTL – logic level)
62	IN10	TXD (TTL – logic level)

Device Configuration

The following sections describe the device configuration with meaning:

- 1: ViH logic high level
- 0: ViL logic low level

CAN Identifier

The CAN Identifier will be set with Pins ID0 to ID6. This configuration pins use internal inverter. The ID is set as follows:

ID6	ID5	ID4	ID3	ID2	ID1	ID0	CAN-Identifier
1	1	1	1	1	1	1	Programmable ID 1 = 0x01
1	1	1	1	1	1	0	2 = 0x02
1	1	1	1	1	0	0	3 = 0x03
1	1	1	1	0	1	1	4 = 0x04
1	0	0	0	0	0	0	63 = 0x3F
0	1	1	1	1	1	1	64 = 0x40
0	1	1	1	1	1	0	65 = 0x41
0	0	0	0	0	1	0	125 = 0x7C
0	0	0	0	0	0	1	126 = 0x7E
0	0	0	0	0	0	0	127 = 0x7F

All Identifiers from 1 to 127 are valid settings. Identifier 0 is used to load the ID from object 2100.

Baud rate

The baud rate configuration will be done with configuration inputs BD0 to BD2

BD2	BD1	BD0	CAN-Baud Rate / Bus length
1	1	1	1 Mbit/sec 25 m *1)
1	1	0	800 kbit/sec 50 m *1)
1	0	1	500 kbit/sec 100 m *2)
1	0	0	250 kbit/sec 250 m *2)
0	1	1	125 kbit/sec 500 m *3)
0	1	0	50 kbit/sec 1000 m *3)
0	0	1	20 kbit/sec 2500 m *3)
0	0	0	10 kbit/sec 5000 m *3)

*1) Calculation without optocouplers.

For optocouplers bus length is reduced for about 4m per 10 nsec propagation delay of employed optocoupler type

*2) Calculation with 40 nsec optocoupler propagation delay

*3) Calculation with 100 nsec optocoupler propagation delay

The calculation of the bus length is based on a line propagation delay of 5 nsec/m.

I/O Configuration

Configuration bits CFG0 to CFG1 select the I/O configuration of the CO4012 chip.

CFG Pins	I/O Configuration	
	Mode	Description
3 2 1 0		
1 1 1 1	0	20 digital input lines 12 digital output lines
1 1 1 0	1	12 digital input lines 12 digital output lines 8 analog input lines Analog: 8-Bit PDO mapping *1)
1 1 0 1	2	16 digital input lines 12 digital output lines 4 analog input lines Analog: 16-Bit PDO mapping
1 1 0 0	3	16 digital input lines 16 digital output lines
1 0 1 1	4	12 digital input lines 20 digital output lines
1 0 1 0	5	4 digital input lines 20 digital output lines 8 analog input lines Analog: 8-Bit PDO mapping *1)
1 0 0 1	6	8 digital input lines 20 digital output lines 4 analog input lines Analog: 16-Bit PDO mapping
1 0 0 0	7	Reserved *2)
0 0 0 0	15	8 digital input lines 8 digital output lines
0 0 0 1		Reserved *2)
0 0 1 X		Reserved *2)
0 1 X X		Reserved *2)

*1) This modes have default PDO mapping which is not according to CiA standard DS401.

*2) These modes are reserved for future use and must not be set. Selecting the reserved modes may cause improper operation of the device.

also section "Mapping I/O to Object Dictionary" for additional information

Power Down Mode

During power down, the CO4011B stops working completely. Even the oscillator is stopped. The CO4011B keeps its NMT state (operational, preoperational).

The complete power down extension is optional and may be switched on and off, so that the same chip can be used for standard applications as well.

In power down configuration a Wake-Up-Interrupt-Input (WUII pin2) can be used for wake up by CAN bus line and optional an additional Reset-Power-Down-Input (RPDI: pin1) may be used for system wake up using a push button or something like that. Both inputs are active low. WUII must be directly connected to CANRX (pin 64) on the application board if wake up by CAN bus line (telegram) is required.

A counter is implemented which counts the number of the return from power down operations.

All output lines keep unchanged during the power down state.

For power down control 6 objects are added to the object dictionary of the CO4011B:

Power-Down Enable
Switch to Power-Down Mode
Reset Power Down Input Enable
Wake Up Counter
Power-Down Delay Time
Wake-Up-Confirm-Time

Activate Power-Down

To enable the power down mode the following actions are necessary

The object Power-Down-Enable (2FFE) has to be written to with the signature 0x5044454E ("PDEN"). With that, the pin WUII is configured at the same time. The signature can be written by SDO transfer but it may also stay saved together with the object dictionary in the chips non-volatile memory.

The activation of Power-Down is done by writing the signature 0x504F4646 ("POFF") to the object "Switch to Power-Down-Mode" (2FFF). This access must be done by SDO transfer.

After the CO4011B has recognized a power down instruction, it is waiting until the SDO answer telegram was sent to the bus.

After an additional waiting time corresponding to the "Power-Down Delay Time" object, the CO4011B switches to power-down mode.

If Object "Power Down with Stop Node" (2FF9) is set to its valid signature 0x454E534E, the Chip is also switched to Power down with the NMT Telegram Stop Node.

Return from Power-Down

If pin WUII (Wake-Up-Interrupt-Input) is connected to CANRX the CO4011B can be waked up by any CAN telegram. Even a level change on the CAN bus line is enough. The CO4011B restarts the CAN module after handling the interrupt and scans incoming telegrams. If a valid NMT telegram is received on identifier 0 during a time out corresponding the "Wake-Up-Confirm-Time" object, the CO4011B switches back to normal operation mode. Otherwise the power down state is activated again.

NOTE: Because of the different start up times of the oscillator during wake up it might happen, that the CO4011B already interprets the wake up telegram as a valid CAN message, but this can not be guaranteed. That's why an identifier should be selected for wake up, which isn't used by a CAN message in the application.

After wake up with Reset Power Down Input pin an emergency message is sent and the normal run is restarted without any additional CAN messages needed.

The wake up counter is incremented by each wake up event. That is irrespective of whether a correct NMT telegram also will be recognized or not after a wake up interrupt by CAN bus. Therefore a definite handling how many wake up events were done is possible.

Emergency-Message

The CO4011B sends the emergency telegram after wake up by pin "Reset Power Down Input" with the following content:

Error-Code	0xF000
Error Register	0x01
Manufacturer specific Error Field	0x00000100

After an additional waiting time which corresponds to the "Wake-Up-Confirm-Time" object, an additional emergency telegram with content 0 is sent. This indicates the reset of all errors.

Object Dictionary

The CO4011B Single Chip CANopen Controller implements a complex object dictionary for CANopen I/O devices.

For detailed information about CANopen objects see additional brochure "Introduction to CANopen"

DS301: global Objects

For the Object tables all values are shown in hexadecimal way.

For access type the following settings are valid

ro	read only
wo	write only
rw	read and write access enabled

Notes:

- *1) This object cannot be written to in operational device state.
Only use this command in preoperational device state, otherwise the CO4011B will answer requests with SDO abort telegrams.
- *2) This objects show the chip type and version as visable strings.
- *3) This Objects shows "Frenzel + Berg" as visible string data type.
- *4) The New Node Id object gives the possibility to set a Node-Nr independent from the Node-Id Input Bits. With this feature the device may be configured by CAN bus line.
- *5) This object is not accessible for the application because of standard conforming reasons.
- *6) This object is implemented to give the user the possibility to add application related info to the dictionary. This object may be saved to non volatile memory using the "Store Parameters" command.

Note: All "Visible String" data type objects are restricted to a maximum of 20 characters.

The data type entries Index 0005 to 0007 are implemented for compatibility reasons. They may be mapped to PDOs in order to define the appropriate space in the PDO.

For the read only objects following data is set:

Index	Sub.	Name	Value in Hex.
1000		Device Type	0007 0191 h
1018	0	Identity Object	04h
	1	Vendor ID	0000 0058 h
	2	Product Code	0104 0111 h
	3	Revision Number	0 .. 0xFFFFFFFF
	4	Serial Number	0
2101		System Configuration	Set according to the setting of the configuration input bits.

DS301: PDO Parameter Objects

Description of PDO Parameter objects:

These Objects enable dynamic PDO mapping, variable identifier distribution for PDOs and setting of the transmission mode, inhibit and event times.

For the CO4011B setting of all parameters may be done in the device state "operational" as well as in "preoperational" state.

Index	Sub-Index	Name	Acc.
1400	0	Receive PDO1 Communication Parameter	ro

1801 ... 1803		Transmit PDO2 to TPDO4 Communication Parameter same as 1800.00 .. 1800.05	rw
1A00	0	Transmit PDO1 Parameter mapping	rw
	1 to n	Mapped Object (max. 8 objects mappable)	rw
1A01 ... 1A03		Transmit PDO2 to TPDO4 Parameter mapping Same as 1A00	rw

Note:

The CO4011B supports only 2 receive and 2 transmit PDOs. All Objects for higher PDO numbers are not implemented.

Note:

For detailed information about CANopen objects see additional brochure "Introduction to CANopen"

DS401: Digital Input Objects

Index	Sub-Index	Name	Acc.
5001	0 to n	Write 1 to digital input 8 bit	rw
5002	0 to n	Write 0 to digital input 8 bit	rw
5003	0 to n	Filter time for each digital input	rw
5800	-	Input interrupt bit map	ro
5801	-	Input interrupt transmit ID	rw
5802	-	Input interrupt mask	rw
5803	-	Input interrupt cycle time	rw
6000	0 to n	Read digital input 8 bit	ro
6002	0 to n	Polarity input 8-bit	rw
6003	0 to n	Filter constant enable 8 bit	rw
6005		Global interrupt enable	rw
6006	0 to n	Interrupt mask: any change	rw
6007	0 to n	Interrupt mask rising edge	rw
6008	0 to n	Interrupt mask falling edge	rw
6100	0 to n	Read digital input 16 bit	ro
6120	0 to n	Read digital input 32 bit	ro

The objects 5001 and 5002 are implemented for debug purposes, because the CANopen object 6000 does not allow write access to an input line. With objects 5001 and 5002 a debug environment may simulate setting or resetting of input lines. The CO4011B first scans the physical input lines and then processes the scanned values with the debug parameters.

Index 5001 and 5002 make direct bit manipulation of single bits possible.

Index 5001 enables bit setting by using a bit wise logical OR conjunction with index 6000 while index 5002 performs a logical AND conjunction with index 6000 and therefore enables resetting of single bits.

Objects 5001 and 5002 are always working in continuous execution mode. This means that logical operations with object 6000 are performed in each internal input scan cycle

With object 5003 an individual filter constant (value in msec) may be assigned to each input line. This gives great flexibility to prevent inputs from distortion. The default value for filter constant is 5msec. The filter constants enable object is at index 6003.

DS401: Digital Output Objects

Index	Sub-Index	Name	Acc.
5200	-	Reset Output Object on Error	rw
6200	0 to n	Write Output 8 Bit	rw
6202	0 to n	Change Polarity Output 8 bit	rw
6206	0 to n	Error Mode Output	rw

2FFF	0	Switch To Power Down Mode	rw

Description of Object Dictionary

The following list gives a short description of all dictionary entries.

Index 0005

This object is implemented to enable reservation of data space in PDOs by mapping dummy entries.

Index	0005
Name	Dummy 8
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	Yes
Value Range	-
Default Value	0

Index 0006

This object is implemented to enable reservation of data space in PDOs by mapping dummy entries.

Index	0006
Name	Dummy 16
Description	-
Data Type	Unsigned 16
Access modes	RO
PDO Mapping	Yes
Value Range	-
Default Value	0

Index 0007

This object is implemented to enable reservation of data space in PDOs by mapping dummy entries.

Index	0007
Name	Dummy 32
Description	-
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	Yes
Value Range	-
Default Value	0

DS301: Global Objects**Index 1002 : Status Register**

This object gives additional information for the device

Index 1000 : Device Type

Description of the device type. The Object gives the CiA device profile number and additionally the functionality of the device.

Index	1000h	
Name	Device Type	
Description	-	
Data Type	Unsigned 32	
Access modes	RO	
PDO Mapping	Yes	
Value Range	-	
Default Value	-	
Operation Mode	Value of Index	
CO4011B0	0003 0191 h	
CO4011B1	0007 0191 h	
CO4011B2	0007 0191 h	
CO4011B3	0003 0191 h	
CO4011B4	0003 0191 h	
CO4011B5	0007 0191 h	
CO4011B6	0007 0191 h	

Index 1001 : Error Register

This object holds an error of the device.

Index	1001h	
Name	Error Register	
Description	-	
Data Type	Unsigned 8	
Access modes	RO	
PDO Mapping	Yes	
Value Range	-	
Default Value	-	

The error register has the following structure

Bit	Meaning
0	Generic error. This bit is set, if any error is active
1	0
2	0
3	0
4	CAN bus or communication error
5	0
6	0
7	Device Error

Index	1002h
Name	Status Register
Description	-
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	Yes
Value Range	-
Default Value	-

Index 1005 : COB-ID Sync

Identifier of Can Object for the Synchronisation message. The CO4011B may only operate in Sync consumer mode. Generating of Sync messages is not possible. Therefore the Identifier for the Sync message can only be set to the value range 1 .. 7FFh.

Index	1005h
Name	COB-ID Sync
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	1 .. 7FFh
Default Value	80h

Index 1008 : Device Name

This object shows the name of the device as visible string.

Index	1008h
Name	Device Name
Description	-
Data Type	Visible String
Access modes	RO
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	"CO4011B"

Index 1009 : Hardware Version

This object shows the hardware version and firmware version as visible string. The output format is compatible to the format of the chip CO4011A.

Index	1009h
Name	Hardware Version
Description	-
Data Type	Visible String
Access modes	RO
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	-

There are several modes to select a valid node ID.

Hardware-ID > 0

Setting the configuration input bits ID0 to ID6 to any combination other than zero will take the configuration input setting of bits ID0 to ID6 as valid Node-ID. The IDs for Emergency, Guarding and SDO transfer will be set to their default values according to draft standard.

Behaviour at next start up if:**Node-ID is changed**

If the Node-ID is changed against the saved value (stored in Object 100B) The PDO IDs and the PDO-Mapping will be set to default values. This mode can be used to save only DS401 related objects

Node-ID is unchanged

If the Node-ID is still the same as saved in object 100B the PDO IDs keep the values they had during execution of the command "save dictionary"

Hardware-ID = 0

If setting the configuration input bits ID0 to ID6 to the combination zero (all input bits at high level) will activate the Node-ID object 2100h. With this object a Node-ID may be set independent from the configuration input bits. If there is no saved dictionary available, the node ID is set to 126.

In this case the IDs for Emergency, Guarding and SDO transfer will be set to their default values according to the node ID saved to object 2100. The PDO IDs keep the values they had during execution of the command "save dictionary"

If Object 2100h has value 0 (default factory setting if not written to by your application or CANopen configuration tool) the Node ID will be forced to 126 (7Eh).

Note! If using Hardware-ID = 0, the PDO-IDs must be set to their desired values before saving the dictionary. Otherwise the PDO-IDs will refer to node ID 126, which is the default ID when setting ID-Input Pins to Node-ID = 0.

Applications without configuration switches

For applications without any configuration switches the following configuration method must be used:

- All configuration input bits ID0 to ID6 must be forced to HIGH level. This will select Node-ID 0 (zero).
- When starting the device for the first time the Node ID will be set to 126 (7Eh).
- Now the Object 2100h may be set to the desired Node ID by using a CANopen configuration tool.
- Then the PDO IDs must be set to the Identifiers they must have after next restart. (If they are not changed, they will be set according to Node-ID 126)
- The last step is to save this setting by using object 1010h.

Index 100A : Software Version

This object shows the software version as visible string.

Index	100Ah
Name	Software Version
Description	-
Data Type	Visible String
Access modes	RO
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	-

Index 100B : Node-ID

This object keeps the actual node Id. The Object is not represented in the object dictionary because of standard conforming reasons.

Index	100Bh
Name	Node ID
Description	-
Data Type	Unsigned 8
Access modes	Not accessible
PDO Mapping	No
Value Range	1 to 127
Default Value	See below

If the device will be restarted the Node ID will be taken from object 2100h and will be copied to object 100Bh. Additionally the COB-Ids for the Sync-, Emergency-, SDO- messages will be modified according to the new Node ID. The PDO IDs keep the values they had during execution of the command "save dictionary".

Index 100C : Guard Time

The objects at index 100Ch (Guard Time in milliseconds) and 100Dh (Life Time Factor) are used to implement the life guarding protocol. The Guard Time multiplied with the Life Time Factor gives the Life Time in milliseconds.
It is 0 (zero) if not used.

Index	100Ch
Name	Guard Time
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	No
Value Range	
Default Value	0

Index 100D : Life Time Factor

The objects at index 100Ch (Guard Time in milliseconds) and 100Dh (Life Time Factor) are used to implement the life guarding protocol. The Guard Time multiplied with the Life Time Factor gives the Life Time in milliseconds.
It is 0 (zero) if not used.

Index	100Dh
Name	Life Time Factor
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	
Default Value	0

Index 100E : COB-ID Guard

Identifier of Can Object for the Node Guarding protocol. The Object is not represented in the object dictionary because of standard conforming reasons.

Index	100Eh
Name	COB-ID Guard
Description	-
Data Type	Unsigned 32
Access modes	-
PDO Mapping	No
Value Range	-
Default Value	700h + Node-ID

Index 1010 : Store Parameters

This object supports the saving of parameters in non-volatile memory. By read access the device provides information about its saving capabilities. Several parameter groups are distinguished:
Sub-Index 0 contains the largest Sub-Index that is supported.

Writing to Sub-Index 1 means that all parameters shall be stored on the device.

In order to avoid storage of parameters by mistake, storage is only executed when a specific signature is written to the appropriate Sub-Index. (This means that the signature is transferred as data bytes 4 to 7 in the CAN message of the corresponding SDO protocol.

The signature is "save".

MSB	LSB		
e	v	a	s
65h	76h	61h	73h

On reception of the correct signature on sub-index 1 the device stores the parameters and then confirms the SDO transmission (initiate download response). If the storing failed, the device responds with an Abort SDO Transfer (abort code: 0606 0000 h). If a wrong signature is written, the device refuses to store and responds with Abort SDO Transfer (Abort code: 0800 002x h).

Index	1010h
Name	Store Parameters
Description	-
Data Type	Structure

Index	1010h Subindex 0
Name	Largest SubIndex supported
Description	-
Data Type	Unsigned char
Access modes	RO
PDO Mapping	No
Value Range	
Default Value	4

Index	1010h Subindex 1
Name	Store All Parameters
Description	Writing to this object stores the dictionary to non-volatile memory.
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	Signature "save"
Default Value	-

By read access to object 1010h Subindex 1, the device responds with SDO data 00000001h indicating that storing of data is only done on command.

Note:

Writing to this object is only allowed in pre-operational mode.

If the command "save" is directly executed after a chip bootup that restores the default configuration (using object 1011), the CO4011B clears the previously saved dictionary from non volatile memory.

If the Configuration Setting is changed against the setting according to the object dictionary saved to the non volatile memory, the chip will clear the saved dictionary and will resume to the default configuration.

The command "save" stores the complete object dictionary to the non volatile memory.

Only the objects that represent the I/O state of the CO4011B will not be saved.

(6000, 6200, ..)

The saving of the PDO-IDs depends on the mode setting the node ID. (See object 100B for further details)

See also object 100B for setting a valid Node-ID using the "save dictionary" command

Index	1010h Subindex 2
Name	Store Communication Parameters
Description	This feature is not supported
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	-

The CANopen Chip does not support storing of the Communication Parameters independent from the other parameters. This object is only implemented for compatibility reasons.

Index	1010h Subindex 3
Name	Store Application Parameters
Description	This feature is not supported
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	-

The CANopen Chip does not support storing of the Draft Standard 401 related Application Parameters independent from the other parameters. This object is only implemented for compatibility reasons.

Index	1010h Subindex 4
Name	Store Application Info Parameters
Description	This feature saves object 2002 without saving other dictionary informations.
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	Signature "save"
Default Value	-

If "Store Application Info Parameters" object 2002 is saved to the non-volatile memory. This gives the possibility to save the application info, without saving any other data of the object dictionary. If only Object 2002 is saved, this data will not be lost if the configuration is changed.

If the complete dictionary including object 2002 must be saved, this must be done using object 1010.1.

Note:

Using "Store Application Info Parameters" after "Store All Parameters" will delete the complete dictionary from the NV-memory except object 2002. So take care of the correct command usage.

Index 1011 : Restore Default Parameters

With this object the default values of parameters according to the communication or device profile are restored. By read access the device provides information about its capabilities to restore these values. Several parameter groups are distinguished:

Sub-Index 0 contains the largest Sub-Index that is supported.

Writing to Sub-Index 1 restores all parameters that can be restored.

In order to avoid the restoring of default parameters by mistake, restoring is only executed when a specific signature is written to the appropriate sub-index. (This means that the signature is transferred as data bytes 4 to 7 in the CAN message of the corresponding SDO protocol.

The signature is "load".

MSB	a	o	l	LSB
64h	61h	6Fh	6Ch	

On reception of the correct signature on sub-index 1 the device restores the parameters and then confirms the SDO transmission (initiate download response). If the storing failed, the device responds with an abort SDO transfer (abort code: 0606 0000h).

If a wrong signature is written, the device refuses to store and responds with Abort SDO Transfer (Abort code: 0800 002x h).

The default values are set valid after the device is reset (reset node) or power cycled. If the device requires storing on command (see Object 1010h), the appropriate command has to be executed after the reset if the default parameters are to be stored permanently.

Index	1011h
Name	Restore Default Parameters
Description	-
Data Type	Structure

Index	1011h Subindex 0
Name	Largest SubIndex supported
Description	-
Data Type	Unsigned char
Access modes	RO
PDO Mapping	No
Value Range	1
Default Value	1

Index	1011h Subindex 1
Name	Restore All Parameters
Description	Writing to this object restores the default values to the dictionary.
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	Signature "load"
Default Value	-

By read access to object 1011h Subindex 1, the device responds with SDO data 00000001h indicating that restoring of default data is available.

Note:

Writing to this object is only allowed in pre-operational mode.

Index 1014 : COB-ID Emergency

Identifier of Can Object for the emergency messages.

Index	1014h
Name	COB-ID Emergency
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	80h + Node-ID

Index 1015 : Inhibit Time Emergency

Inhibit Time for emergency messages. If the Inhibit Time is set to 0, inhibit delay is disabled. The Inhibit Time is a multiple of 100usec, but the CO4011B offers a maximum resolution of 1 millisecond.

Index	1015h
Name	Inhibit Time Emergency
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Index 1017 : Producer Heartbeat Time

The producer heartbeat time defines the cycle time of the heartbeat. The producer heartbeat time is 0 if it not used. The time has to be a multiple of 1ms.

Index	1017h
Name	Producer Heartbeat Time
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Note:

Either Heartbeat or node guarding may be allowed at the same time. Do not use both protocols at the same time.

See additional brochure for further information about heartbeat protocol.

Index 1018 : Identity Object

The object at index 1018h keeps general information about the device and the manufacturer frenzel + berg elektronik. It cannot be modified.

Index	1018h
Name	Identity Object
Description	-
Data Type	Structure

Index	1018h Subindex 0
Name	Largest SubIndex supported
Description	-
Data Type	Unsigned char
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	4

Index	1018h Subindex 1
Name	Vendor ID
Description	Registration Code of frenzel + berg elektronik at the CiA
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	58h

Index	1018h Subindex 2
Name	Product Code
Description	Internal Product Code for CO4011B at frenzel + berg elektronik
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	0104 0111 h

Index	1018h Subindex 3
Name	Revision Code
Description	-
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Revision of the device

Index	1018h Subindex 4
Name	Serial Number
Description	
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	0

Index 1029 : Error Behaviour

With object 1029 the CANopen chip can be configured to enter alternatively the preoperational or the stopped state or remain in the current state in case of a device failure. Device failures shall include the following communication errors:

Bus-off conditions of the CAN interface, Life guarding error, Serious device errors also can be caused by device internal failures.

The value of the Error Classes is as follows:

- 0 = pre-operational
(only if current state is operational)
- 1 = no state change
- 2 = stopped
- 3 .. 127 = reserved

Index	1029h
Name	Error Behaviour Object
Description	-
Data Type	Structure

Index	1029h Subindex 0
Name	Largest SubIndex supported
Description	-
Data Type	Unsigned char
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	2

Index	1029h Subindex 1
Name	Communication Error
Description	NMT state change in case of communication error
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	00h

Index	1029h Subindex 2
Name	Application Error
Description	NMT state change in case of pin EMY0# is at low level
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	00h

Index 2000 : Device Manufacturer

This Object shows "Frenzel + Berg" as visible string. If OEMs do not want to give access to this entry, it may be removed from the EDS (electronic data sheet).

Index	2000h
Name	Device Manufacturer
Description	-
Data Type	Visible String
Access modes	RO
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	"Frenzel + Berg"

Index 2002 : Application Info

With object 2002 the user may add additional information to the dictionary. This might be used to identify different application board revisions or anything like that. In order to save this info permanently to non volatile memory the store parameter commands (objects 1010.1 or 1010.4) may be used.

Index	2002h
Name	Application Info
Description	-
Data Type	Structure

Index	2002h Subindex 0
Name	Largest SubIndex supported
Description	-
Data Type	Unsigned char
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	5

Index	2002h Subindex 1
Name	Application Vendor Name
Description	This object keeps the company name of application board vendor
Data Type	Visible String
Access modes	RW
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	"FRENZEL + BERG"

Index	2002h Subindex 2
Name	Application Name
Description	This object keeps the name of the application board.
Data Type	Visible String
Access modes	RW
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	"CO4011B"

Index	2002h Subindex 3
Name	Application Add-Info
Description	This object keeps additional string information.
Data Type	Visible String
Access modes	RW
PDO Mapping	No
Value Range	The maximum string length is 20 characters
Default Value	" FRENZEL + BERG "

Index	2002h Subindex 4
Name	Application Version1
Description	This object keeps a Version or revision code
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	

Index	2002h Subindex 5
Name	Application Version2
Description	This object keeps a Version or revision code
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	

Index 2100 : New Node ID

This Object is implemented to enable applications without any switches for setting the node ID. This object enables setting of the node ID by using SDO transfer.

Index	2100h
Name	New Node ID
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

If no node ID is selected with configuration input bits ID0 to ID6. The New Node ID object is enabled.
See Index 100B for details in setting the node ID.

Index 2102 : Remapping Enabled Info

This Object informs the user whether the system configuration enables remapping of the PDOs. A value of 0 means that remapping is disabled, all other values indicate that remapping of the PDOs is enabled.

Index	2102h
Name	Remapping Enabled Info
Description	-
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	1

Index 2101 : System Configuration

This Object returns the operation mode of the CO4011B. It represents the inverted Setting of the configuration input bits CFG0 to CFG3.

Index	2101h
Name	System Configuration
Description	-
Data Type	Unsigned 32
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Depends on CFG0 to CFG3

Index 2103 : Enabled Guarding Warning

This Object enables/disables transmission of emergency messages in case of a node guarding warning.

The condition of a guarding warning is met, if the time between two node guarding frames increases the guarding time given in object 100C independent of the setting of the life time (object 100D). The node guarding warning does not cause any NMT state change or switching the output pins to the error state. It is implemented to give the CANopen master an early information that the guarding interval has already exceeded the predefined value.

0 : Guarding Warning is disabled

1 : Guarding Warning is enabled

Index	2103h
Name	Enable Guarding Warning
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Index 2110 : Enable Boot Up Message

This Object enables or disables sending of the boot up message. The boot up message is CAN object with the identifier of the node guarding object and only one data byte with value 0 (zero).

If object 2110h is set to 0 the boot up message is disabled otherwise it is enabled.

Index	2110h
Name	Enable Boot Up Message
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	1 (enabled)

Index 2180 : CAN Restart Time

This Object gives the restart time out for the CAN communication layer in case of bus off errors in milliseconds.

If the restart time is set to 0 automatic restart of the device in case of bus off is prohibited.

Index	2180h
Name	CAN Restart Time
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	No
Value Range	0 .. 50000
Default Value	1000 (restart after one second)

DS301: PDO Parameter Objects**Communication Parameter Objects**

The following table shows the communication parameter objects for Index 140x (Receive PDOs) and Index 180x (Transmit PDOs). The tables show Index 1400 as an example for all PDOs

The transmission type (sub-index 2) defines the mode for transmission / reception of the PDO. See table for detailed description of this entry.

Description of transmission type:

Type	PDO transmission				
	cyclic	acyclic	Sync related	Async.	Only on remote
0		X	X		
1-240	X		X		
241-251	Reserved				
252			X		X
253				X	X
254				X	
255				X	

Synchronous (transmission types 0-240 and 252) means that the transmission of the PDO shall be related to the SYNC object. Asynchronous means that the transmission of the PDO is not related to the SYNC object.

A transmission type of zero means that the message shall be transmitted synchronously with the SYNC object but not periodically but only in case of data change.

A value between 1 and 240 means that the PDO is transferred synchronously and cyclically, the transmission type indicating the number of SYNC signals, which are necessary to trigger PDO transmissions or receptions.

The transmission types 252 and 253 mean that the PDO is only transmitted on reception of a remote frame. At transmission type 252, the data is updated (but not sent) immediately after reception of the SYNC object. At transmission type 253 the data is updated at the reception of the remote frame. These values are only possible for transmit PDOs.

Transmission type 255 means, the application event is defined in the device profile. For receive PDOs the reception of a PDO will update the mapped data (normally the analog or digital outputs).

Sub-index 3h contains the inhibit time. This time is a minimum interval for PDO transmission. The value is defined as multiple of 100us.

Sub-index 4h is reserved.

In mode 254/255 additionally an event time can be used for TPDO. If an event timer exists for a TPDO (value not equal to 0) the elapsed timer is considered to be an event. The event time is a multiple of 1 ms. This event will cause the transmission of this TPDO in addition to otherwise defined events.

Index	1400h

Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

The PDO communication parameter objects have the same structure for all PDOs. The following Objects are used.

Index	PDO
1400h	Receive PDO1 (digital output)
1401h	Receive PDO2 (analog output) Not implemented in CO4011B
1800h	Transmit PDO1 (digital input)
1801h	Transmit PDO2 (analog input)

PDO Mapping Objects

The following table shows the PDO Mapping Objects. The principle of PDO mapping is the same for all PDOs. The PDO Mapping table is the cross reference between the Object dictionary entries (for example the data of an digital output byte) and the data field inside an PDO data field (position in the data field of a CAN message for PDO transfer).

Subindex 0 determines the valid number of objects that have been mapped. The CO4011B allows a maximum of 8 mapped objects for each PDO. For changing the PDO mapping first subindex 0 must be set to 0 (mapping is deactivated). Then the objects can be remapped. When a new object is mapped by writing a subindex between 1 and 8, the device may check whether the object specified by index /subindex exists. If the object does not exist or the object cannot be mapped, the SDO transfer will be aborted.

If the special CAN features are enabled (CFG3=0), the CO4011B allows adding of additional mapping entries without resetting subindex 0. In this case the device calculates the number of mapped objects by itself and modifies subindex 0 respectively.

Subindexes 1 to 8 keep the pointers of the mapped objects as unsigned 32 values. The value is 0 if there is no mapped object. The structure for these pointers is as follows.

MSB	LSB		
Byte3	Byte2	Byte1	Byte0
Mapped index	Subindex	Length	

Mapped Index and Subindex together are the Pointer to the Object dictionary data to be mapped at this location.

Length gives the length of the mapped object in bytes.

The following mapping object uses index 1600 as an example for all mapping objects.

Index	1600h
Name	Receive PDO1 Mapping Parameters
Description	-
Data Type	Array

Index	1600h Subindex 0
Name	Largest SubIndex supported
Description	Number of mapped objects
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	According to operation mode

Index	1600h Subindex 1 to 8
Name	Mapped object
Description	
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	According to operation mode

Example:

As an example for PDO mapping, the following table shows the default mapping for transmit PDO1 in operation mode 0 (20 digital in/12 digital out).

Index	Entry	Explanation
1A00.00	3	There are 3 mapped objects in transmit PDO1
1A00.01	60000108h	First mapped object: Input Byte0
1A00.02	60000208h	First mapped object: Input Byte1
1A00.03	60000308h	First mapped object: Input Byte2

The data of the transmit PDO1 for this example will be three bytes. (Input Bytes 0 to 3)

The PDO mapping objects have the same structure for all PDOs. The following Objects are used.

Index	PDO
1600h	Receive PDO1 (digital output)
1601h	Receive PDO2 (analog output) Not implemented in CO4011B
1A00h	Transmit PDO1 (digital input)
1A01h	Transmit PDO2 (analog input)

All objects with PDO mapping capabilities (not only digital or analog I/O) may be mapped to one of the PDOs.

DS401: Digital Input Objects

The following objects are describing the functionality of the digital input lines of the CO4011B. The CO4011B supports 8, 16 and 32 bit access to the digital inputs.

For the first 8 digital input lines in each mode there is a special interrupt feature implemented, that allows fast reaction on input change.

Index 5001/2 : Write to Digital Input

The object 5001 and 5002 are implemented for debug purposes, because the CANopen object 6000 does not allow write access to an input line. With objects 5001 and 5002 a debug environment may simulate setting or resetting of input lines. The CO4011B first scans the physical input lines and then processes the scanned values with the debug parameters.

Index 5001 and 5002 make direct bit manipulation of single bits possible. Index 5001 enables bit setting by using a bit wise logical OR conjunction with index 6000 while index 5002 performs a logical AND conjunction with index 6000 and therefore enables resetting of single bits.

Objects 5001 and 5002 are always working in continuous execution mode. This means that logical operations with object 6000 are performed in internal input scan cycle excepting interrupt feature.

Index	5001h (5002h)
Name	Write 1 to digital input (Write 0 to digital input)
Description	-
Data Type	Array

Index	Subindex 0
Name	
Description	Number of mapped objects
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	NO
Value Range	-
Default Value	Number of digital input bytes

Index	Subindex 1 to Nr of input bytes
Name	
Description	Bitmap to mask input byte with
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	YES
Value Range	-
Default Value	0 for 5001 (OFFh for 5002)

Index 5003 : Filter Time Digital Input

The CO4011B offers noise filtering for each digital input line. With object 5003 an individual filter time may be assigned to each input line.

The filtering function enable object is at index 6003h. The filter time is set in milliseconds. A value of 0 disables the filtering function.

Index	5003h
Name	Filter Time Digital Input
Description	-
Data Type	Array

Index	Subindex 0
Name	Nr of Subobjects
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Number of digital input lines

Index	Subindex 1 to Nr of input lines
Name	Filter Time
Description	There is a individual Time for each input line.
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	5

Index 5800 : Input-Interrupt-Value

This object shows the last scanned input bit pattern, that is scanned from the first 8 input lines.

Note, that the CO4011B has active low input lines.

Index	5800
Name	Input-Interrupt-Value
Description	Last scanned value for Input-Interrupt-Feature
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	-

For the Input-Interrupt-Feature, the CANopen-Chip scans the first 8 digital input pins in a higher priority cycle. The cycle time can be set from 100 to 500 micro seconds using object 5803 "Input-Interrupt-Cycle-Time". If the CANopen-Chip detects a change of the pin states of the first 8 digital input pins, a CAN frame with the Input-Interrupt-CAN-ID, 1 data byte length and the data content of the Input-Interrupt-Value is transmitted to the CAN bus line using the Input-Interrupt-CAN-ID.

No PDO trigger conditions are considered. In order to enable or disable single input pins for the Input-Interrupt-Feature, a bit mask is implemented in object 5802.

Index 5802 : Input-Interrupt-Mask

With the Input-Interrupt-Mask single input lines may be enabled or disabled for the Input-Interrupt-Feature.

Mask-Bit	Enables or disables
Bit0	First digital input pin
Bit1	Second digital input pin
...	...
Bit7	8. digital input pin
Function of each bit	
Bit x = 1	Associated input pin is enabled for Input-Interrupt-Feature
Bit x = 0	Associated input pin is disabled for Input-Interrupt-Feature

Index	5802
Name	Input-Interrupt-Mask
Description	Mask for Input-Interrupt-Feature
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0 (all input pins disabled)

Index 5803 : Input-Interrupt-Cycle-Time

The Input-Interrupt-Cycle-Time specifies the time period for calling the Input-Interrupt-Feature.

Index	5803
Name	Input-Interrupt-Cycle-Time
Description	Cycle time for Input-Interrupt-Feature in micro seconds.
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	No
Value Range	100 .. 500
Default Value	500

Note:

Reaction time does not only depend on the setting of the Input-Interrupt-Cycle-Time, but also on CAN baud rate, bus load and other parameters. The cycle time specifies only the time within the scanning of the input lines and checking for a new interrupt and preparing of new CAN transmission is done.

Index 5801 : Input-Interrupt-CAN-ID

CAN-Identifier that is used for transmission of the Input-Interrupt-Value.

Setting the Input-Interrupt-CAN-ID to 0 disables the Input Interrupt Feature.

Index	5801
Name	Input-Interrupt-CAN-ID
Description	CAN-ID for Input-Interrupt-Feature
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0 (Input interrupt feature is disabled)

Index 6000 : Read Digital Input 8 Bit

This object represents the digital input bytes. The value of the input lines is written to this object.

Before writing the level of the input lines to object 6000, the input data is processed in the following way:

- 1) The digital input lines are active low. This means, the input level is inverted at first.
- 2) At the next stage, the CO4011B processes the filtering function. Object 5003 gives the filtering time and object 6003 enables or disables the channels.
- 3) Then the input lines are inverted again according to the setting of object 6002h (polarity input)
- 4) At last the debug function calculates a logical OR conjunction between the input lines and object 5001 and a logical AND with object 5002 and then writes the result to object 6000h

The number of digital input bytes depends on the selected operation mode.

The mapping of the I/O lines to object 6000 is explained in chapter "Mapping I/O to Object Dictionary"

Index	6000h
Name	Digital Input 8 Bit
Description	-
Data Type	Array

Index	Subindex 0
Name	Nr of Subobjects
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Number of digital input bytes

Index	Subindex 1 to Nr of input bytes
Name	Digital Input 8 Bit Byte n
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	Yes
Value Range	-
Default Value	-

Index 6100 : Read Digital Input 16 Bit

This object enables 16-Bit access to the digital input bytes. The Object addresses the same data area as object 6000 but using unsigned integer data type. See Index 6000 for further details.

Index 6120 : Read Digital Input 32 Bit

This object enables 32-Bit access to the digital input bytes. The Object addresses the same data area as object 6000 but using unsigned long data type. See Index 6000 for further details.

Index 6002 : Polarity Input 8 Bit

With this object, the digital inputs may be inverted. See also Index 6000 for additional information.

The number of digital input bytes depends on the selected operation mode.

Index	6002h
Name	Polarity Input 8 Bit
Description	-
Data Type	Array

Index	Subindex 0
Name	Nr of Subobjects
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Number of digital input bytes

Index	Subindex 1 to Nr of input bytes
Name	Polarity Input 8 Bit Byte n
Description	
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Index 6003 : Filter Enable Input 8 Bit

With this object, the additional input filtering may be enabled individual for each input. 0 at the input line corresponding bit position means filter is disabled. See also Index 5003.

The number of digital input bytes depends on the selected operation mode.

Index	6003h
Name	Filter Enable Input 8 Bit
Description	-
Data Type	Array

Index	Subindex 0
Name	Nr of Subobjects
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Number of digital input bytes

Index	Subindex 1 to Nr of input bytes
Name	Filter Enable 8 Bit Byte n
Description	
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Index 6005 : Global Interrupt Enable

This object enables or disables globally the interrupt behaviour without changing the interrupt masks.

In event-driven mode the device transmits the input values depending on the interrupt masks in objects 6006h, 6007h, and 6008h and the PDO transmission type.

TRUE (1)= global interrupt enabled
FALSE (0)= global interrupt disabled

Index	6005h
Name	Global Interrupt Enable
Description	-
Data Type	Boolean
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	TRUE

Index 6006 : Interrupt Mask Any Change

This object determines, which input lines shall activate an interrupt by any change of the input line. Both negative and positive edge will cause an interrupt, if enabled.

An interrupt will cause a PDO transmission in case of event driven transmission mode.

1 = interrupt enabled

0 = interrupt disabled

Index	6006h
Name	Interrupt Mask any change
Description	-
Data Type	Array

Index	Subindex 0
Name	Nr of Subobjects
Description	
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	No
Value Range	-
Default Value	Number of digital input bytes

Index	Subindex 1 to Nr of input bytes
Name	Interrupt Mask any change
Description	
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0FFh (interrupt enabled)

Index 6007 : Interrupt Mask Low to High

This object has the same structure and behaviour as object 6006h but will cause interrupts only on rising edge of object index 6000. Note that input lines are active low, so rising edge of input data (object 6000) means falling edge of input port line.

Default value is 0.

Index 6008 : Interrupt Mask High to Low

This object has the same structure and behaviour as object 6006h but will cause interrupts only on falling edge of object index 6000. Note that input lines are active low, so falling edge of input data (object 6000) means rising edge of input port line.

Default value is 0.

DS401: Digital Output Objects

The following objects are describing the functionality of the digital output lines of the CO4011B. The CO4011B supports 8, 16 and 32 bit access to the digital outputs.

The number of digital output bytes depends on the selected operation mode.

Index 5200 : Output Reset on Error Option

This Object selects the function for error handling if a critical error is detected.

If the value is 0, the Outputs objects 6200.xx will keep unchanged. The ports will be set to their error state given in object 6207 as long as the error is active. If error ends, the outputs will return to the state according to the output object 6200h.

If the value is 1, the Outputs error handling depends on the objects 6206h and 6207h and the output object 6200 will be overwritten with the error output state according to objects 6206 and 6207.

Index	5200h
Name	Output Reset on Error Option
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	1

Index 6200 : Write to Digital Output

With object 6200, the digital outputs of the CO4011B can be written to. Before writing to the output ports, the value of the bitmap of object 6200 is processed with object 6202 (Change polarity output 8 bit) and the inverted. (Output port bits of the CO4011B device are active low)

The mapping of the I/O lines to object 6200 is explained in chapter "Mapping I/O to Object Dictionary"

Index	6200h
Name	Write to digital output
Description	-
Data Type	Array

Index	Subindex 0
Name	
Description	Number of mapped objects
Data Type	Unsigned 8

Index	Subindex 1 to Nr of output bytes
Name	Write to digital output
Description	
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	YES
Value Range	-
Default Value	0

Index 6300 : Write Digital Output 16 Bit

This object enables 16-Bit access to the digital output bytes. The Object addresses the same data area as object 6200 but using unsigned integer data type. See Index 6200 for further details.

Index 6320 : Write Digital Output 32 Bit

This object enables 32-Bit access to the digital output bytes. The Object addresses the same data area as object 6200 but using unsigned long data type. See Index 6200 for further details.

Index 6202 : Polarity Output 8 Bit

With this object, the digital outputs may be inverted.
See also Index 6200 for additional information.

Value Range	-
Default Value	Number of digital output bytes

DS401: Analog Input Objects

The following objects are describing the functionality of the analog input lines of the CO4011B.

The number of analog input bytes depends on the selected operation mode.

Index 6400 : Read Analog Input 8 Bit

Object 6400, represents the value of the analog channels. The 8 bit conversion result of the analog input voltage is a signed value. Therefore voltages less than 2.5V are read as negative input voltage. An input of 2.5V is read as 0 and an input voltage higher than 2.5V is converted into positive values.

If the application requires reading of the analog input voltage as unsigned values, the object 6431 may be used for adding an offset to the conversion result.

The mapping of the I/O lines to object 6400 is explained in chapter "Mapping I/O to Object Dictionary"

Note:

Object 6400 is only valid if operation mode selects 8 Bit resolution of A/D converter.

Index	6400h
Name	Read Analog Input
Description	-
Data Type	Array

Index	Subindex 0
Name	
Description	Number of mapped objects
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	NO
Value Range	-

Index	Subindex 1 to Nr of input lines
Name	Read Analog Input
Description	
Data Type	Signed 8
Access modes	RO
PDO Mapping	YES
Value Range	-
Default Value	-

Index 6401 : Read Analog Input 16 Bit

Object 6401, represents the value of the analog channels. The 16 bit conversion result of the analog input voltage is a signed value. Therefore voltages less than 2.5V are read as negative input voltage. An input of 2.5V is read as 0 and an input voltage higher than 2.5V is converted into positive values.

If the application requires reading of the analog input voltage as unsigned values, the object 6431 may be used for adding an offset to the conversion result.

The mapping of the I/O lines to object 6401 is explained in chapter "Mapping I/O to Object Dictionary"

Note:

Object 6401 is only valid if operation mode selects 16 Bit resolution of A/D converter.

Index	6401h
Name	Read Analog Input
Description	-
Data Type	Array

Index	Subindex 0
Name	
Description	Number of mapped objects
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	NO

Index	Subindex 1 to Nr of input lines
Name	Read Analog Input
Description	
Data Type	Signed 16
Access modes	RO
PDO Mapping	YES
Value Range	-
Default Value	-

Index 6421 : Analog Input Interrupt Trigger

Object 6421 selects the event that shall cause a transmission interrupt for the selected analog channel.

There is one Subindex for each channel to enable individual setting according to application requirements.

Table of possible Trigger Conditions:

Bit Nr	Interrupt Trigger Selection
0	Input voltage greater than Upper Limit
1	Input voltage less than Lower Limit
2	Input changed by more than Delta
3	Input reduced more than Negative Delta
4	Input increased more than Positive Delta
5 to 7	Reserved (must be forced to zero)

Index	6421h
Name	Analog Input Interrupt Trigger
Description	-
Data Type	Array

Index	Subindex 0
Name	
Description	Number of mapped objects
Data Type	Unsigned 8
Access modes	RO
PDO Mapping	NO
Value Range	-
Default Value	Number of analog input lines

Index	Subindex 1 to Nr of input lines
Name	Analog Input Interrupt Trigger
Description	Selects trigger condition
Data Type	Unsigned 8 (See Table of Trigger Conditions)
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	7

Index 6423 : Analog Input Interrupt Enable

This object enables or disables globally the interrupt behaviour without changing the interrupt masks. The interrupt is disabled by default, in order to avoid transmission of analog input values.

TRUE (1)= global interrupt enabled
FALSE (0)= global interrupt disabled

Index	6423h
Name	Analog Input Interrupt Enable
Description	-
Data Type	Boolean
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	FALSE

Index 6424/5/6/7/8 : Analog Input Interrupt Limits

These objects give the Limit for generation of interrupts. All objects have the same structure. The function of the interrupt limit is only enabled, if the corresponding bit of object 6421 is set. All values of limit parameters are signed 32. So the user must take care not to exceed the range of the input data objects.

Note especially for limit calculations
For calculation whether an interrupt (PDO transmission) must be generated or not, the analog input data object (6400.xx, 6401.xx) is always evaluated as signed value, even if an offset is set to simulate an unsigned value.

Table of Limit Function

Object	Object Name and Function
6424	Analog Input Upper Limit Generate interrupt if input voltage is greater than or equal to Upper Limit (6424)
6425	Analog Input Lower Limit Generate interrupt if input voltage is less than Lower Limit (6425)
6426	Analog Input Interrupt Delta Generate interrupt if input voltage changed by more than Interrupt Delta
6427	Analog Input Negative Delta Generate interrupt if input voltage reduced by more than Negative Delta
6428	Analog Input Positive Delta Generate interrupt if input voltage increased by more than Positive Delta

Index	6424/5/6/7/8/9
Name	See table above
Description	-
Data Type	Array

Index	Subindex 0

PDO Mapping	NO
Value Range	-
Default Value	Number of analog input lines

Index	Subindex 1 to Nr of input lines
Name	See table above
Description	
Data Type	Integer 32
Access modes	RW
PDO Mapping	No
Value Range	-
Default Value	0

Index 6431 : Analog Input Offset

Object 6431 adds an offset value to the analog input data object (6400 / 6401).

The normal input scaling for analog data objects 6400 and 6401 considers conversion of negative input voltages (input amplifier must shift to positive voltages because input port pin is 0 to 5V only) by placing the zero point (of data) to 2.5V. (middle of input voltage range)

If application requires only positive input values an offset may be add with object 6431, in order to adjust the zero point for data to an input voltage of 0V. For 8 Bit analog conversion (object 6400) the offset value (object 6431) must be 8000h. For 16 Bit analog conversion (object 6401) the offset value must be set to 8000h.

For calculating a transmission request for the PDOs the objects 640x.xx are always interpreted as signed integer values.

Index	6431h

Default Value	0

Power Down Control Objects

For control of the Power-Down-Mode several objects are applied in the object dictionary of the CO4011B.

Index 2FF8 : Wake Up NMT state after Power Down with Stop Node

This object sets the NMT state after waking up the slave from power down mode, in case power down was invoked using the NMT command "STOP NODE". If the power down mode was invoked by the power down command using object 2FFF the CO4011B will not change the NMT state.

Index	2FF8
Name	Wake Up NMT state after Power Down with Stop Node
Description	-
Data Type	Unsigned 8
Access modes	RW
PDO Mapping	NO
Value Range	-
Default Value	2

The Wake Up NMT-State is coded as follows:

2	Stopped
1	Operational
128	PreOperational
0	Unchanged
other values	not defined will be redirected to value 4

Note:

Using the NMT command STOP NODE for power down control is not compatible with the CANopen draft standard.

Index 2FF9 : Power Down with Stop Node

This object enables switching the device to power down state by using the NMT command stop node. This feature is enabled by writing the value 0x454E534E ("ENSN" <ENable Stop Node>) to this object and additionally object 2FFE ("Enable Power Down") must be set with the valid signature. As soon as this two signatures are set, the Stop Node Command will switch the Chip to Power down mode.

Index	2FF9
Name	Power Down with Stop Node
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	NO
Value Range	-
Default Value	0

Note:

Using the NMT command STOP NODE for power down control is not compatible with the CANopen draft standard.

Index 2FFA : Wake-Up-Confirm-Time**Wake-Up-Confirm-Time**

The CO4011B switches to the active run mode after a wake up event by pin WUII (Wake-Up-Interrupt-Input).

If it doesn't receive a valid NMT telegram during the Wake-Up-Confirm-Time, so it automatically switches back to the Power-Down-Mode.

The time is given in milliseconds.

The access is done by SDO.

Index	2FFA
Name	Wake-Up-Confirm-Time
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	NO
Value Range	200 .. 20000
Default Value	1000

Index 2FFB : Power-Down-Delay-Time**Power-Down-Delay-Time**

After reception of Power-Down instruction the CO4011B waits for the period Power-Down Delay Time and than switches over in Power-Down-Mode. The time is given in milliseconds.

The access is done by SDO.

Index	2FFB
Name	Power-Down-Delay-Time
Description	-
Data Type	Unsigned 16
Access modes	RW
PDO Mapping	NO
Value Range	0 .. 20000
Default Value	500

Index 2FFD : Reset Power Down Input Pin Enable**Enable "Reset Power Down Input"**

Reset Power Down Input is configured by writing the value 0x5250454E ("RPEN") to this object. As soon as this signature will be written pin1 (IN9) is used as Reset Power Down Input (RPDI). Then it cannot be used as digital input line any more.

Index	2FFD
Name	Reset Power Down Input Enable
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	NO
Value Range	-
Default Value	0

Index 2FFC : Wake-Up-Counter**Wake-Up-Counter**

The Wake Up Counter counts all wake up events of Power-Down-Mode. The access to the counter is done by SDO.

Index	2FFC
Name	Wake-Up-Counter
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	YES
Value Range	-
Default Value	0

Index 2FFE : Power-Down-Enable**Power-Down-Enable**

The use of Power-Down-Mode is enabled by writing the value 0x5044454E ("PDEN") to this object. As soon as this signature will be written, pin2 (IN8) is configured as Wake-Up-Interrupt-Input (WUII). Then it cannot be used as digital input pin any more. The correct signature is the requirement for acceptance of all further power down instructions.

Index	2FFE
Name	Power-Down-Enable
Description	-
Data Type	Unsigned 32
Access modes	RW
PDO Mapping	NO
Value Range	-
Default Value	0

Index 2FFF : Switch-To-Power-Down-Mode**Switch-To-Power-Down-Mode**

Setting the value 0x504F4646 ("POFF") (see above) will force the device to power down mode. After receiving the Switch-To-Power-Down-Mode command, the chip will continue working for the Power-Down-Delay-Time and then will enter power down mode.

The correct signature in object 2FFE is the requirement for acceptance of the Switch-To-Power-Down-Mode instruction.

Index	2FFF
Name	Switch To Power Down Mode
Description	-
Data Type	Unsigned 32
Access modes	WO
PDO Mapping	NO
Value Range	-
Default Value	0

Emergency Messages

The CO4011B supports several emergency messages. For all emergencies the same structure is used:

Byte							
0	1	2	3	4	5	6	7
EMY-Code	1001	0					CO4011-Code

EMY-Code: Emergency-Error-Code according to DS301

1001: Content of Object 1001

CO4011-Code: Emergency-Error-Code for CO4011 as unsigned 32 value

CO4011- Code (hex)	May change		Description
	NMT	I/O	
8000 0000	X	X	CAN bus is bus off
4000 0000			CAN bus in error warning state
2000 0000			Node guarding warning
3000 0000	X	X	Life guarding error
0000 0001	X	X	Output Overload detected
0000 0100			Wake up from Power down

Emergency 2000 0000 (Node guarding warning) must be enabled with object 2103.

If more than one error is active at the same time, the bitmap of the CO4011-Codes for all active errors are combined with a logical or conjunction.

Some of the emergencies may cause a NMT state change and/or may force the output pins to the error state. This behaviour depends on the setting of object 1029.

The ID for emergency transmission is fixed to:
0x80 + \$NodeID.

List of emergency messages:

Node-Guarding Warning							
30	81	01	00	00	00	00	20

This warning occurs, if the masters fails to transmit the guarding remote frame within the specified Guard Time object 100C and if transmission is enabled in object 2103

Life-Guarding Error							
30	81	01	00	00	00	00	30

This error occurs, if the masters fails to transmit the guarding remote frame within the specified Life Time (Guard Time object 100C multiplied with Life Time Factor object 100D)

Output Overload Error							
10	23	01	00	01	00	00	00

This error occurs, if the output overload interrupt input pin (OLIRQ# pin 60) is active low.

CAN Bus in Error Warning state							
00	81	01	00	00	00	00	40

This error occurs, if the chips internal CAN module is in error warning state.

Return from CAN Bus OFF							
40	81	01	00	00	00	00	C0

This message indicates a return from Bus OFF state.

Return from Power Down							
00	F0	01	00	00	01	00	00

This message indicates a return from power down event.

Mapping I/O to Object Dictionary

The mapping of the I/O channels depends on the setting of configuration bits CFG0 to CFG2.

All possible configurations are shown in individual tables. Select the table for your application according to I/O requirements.

Note for A/D converter the maximum resolution is 10 bit. Tables that show analog input with 16-bit mean, that dictionary entry is made as signed integer (16 bit wide).

Summary of operation modes

The following table shows a summary of possible operation modes.

CFG Pins	I/O Configuration	
	Mode	Description
3 2 1 0		
1 1 1 1	0	20 digital input lines 12 digital output lines
1 1 1 0	1	12 digital input lines 12 digital output lines 8 analog input lines Analog: 8-Bit PDO mapping *1)
1 1 0 1	2	16 digital input lines 12 digital output lines 4 analog input lines Analog: 16-Bit PDO mapping
1 1 0 0	3	16 digital input lines 16 digital output lines
1 0 1 1	4	12 digital input lines 20 digital output lines
1 0 1 0	5	4 digital input lines 20 digital output lines 8 analog input lines Analog: 8-Bit PDO mapping *1)
1 0 0 1	6	8 digital input lines 20 digital output lines 4 analog input lines Analog: 16-Bit PDO mapping
1 0 0 0	7	Reserved *2)
0 x x x		Reserved *2)

*1) This modes have default PDO mapping which is not according to CiA standard DS401.

*2) These modes are reserved for future use and must not be set. Selecting the reserved modes may cause improper operation of the device.

The selected operation mode may be read via object 2101h from the object dictionary.

Note:

Setting of configuration must be fixed. The CO4011B scans the setting of CFG0 to CFG3 only during reset. Changing of configuration on the fly is not allowed and may cause improper operation of the device.

Note that configuration pins are input during reset but may be switched to output during operation. See Pin Description for additional information.

Absolute Maximum Ratings

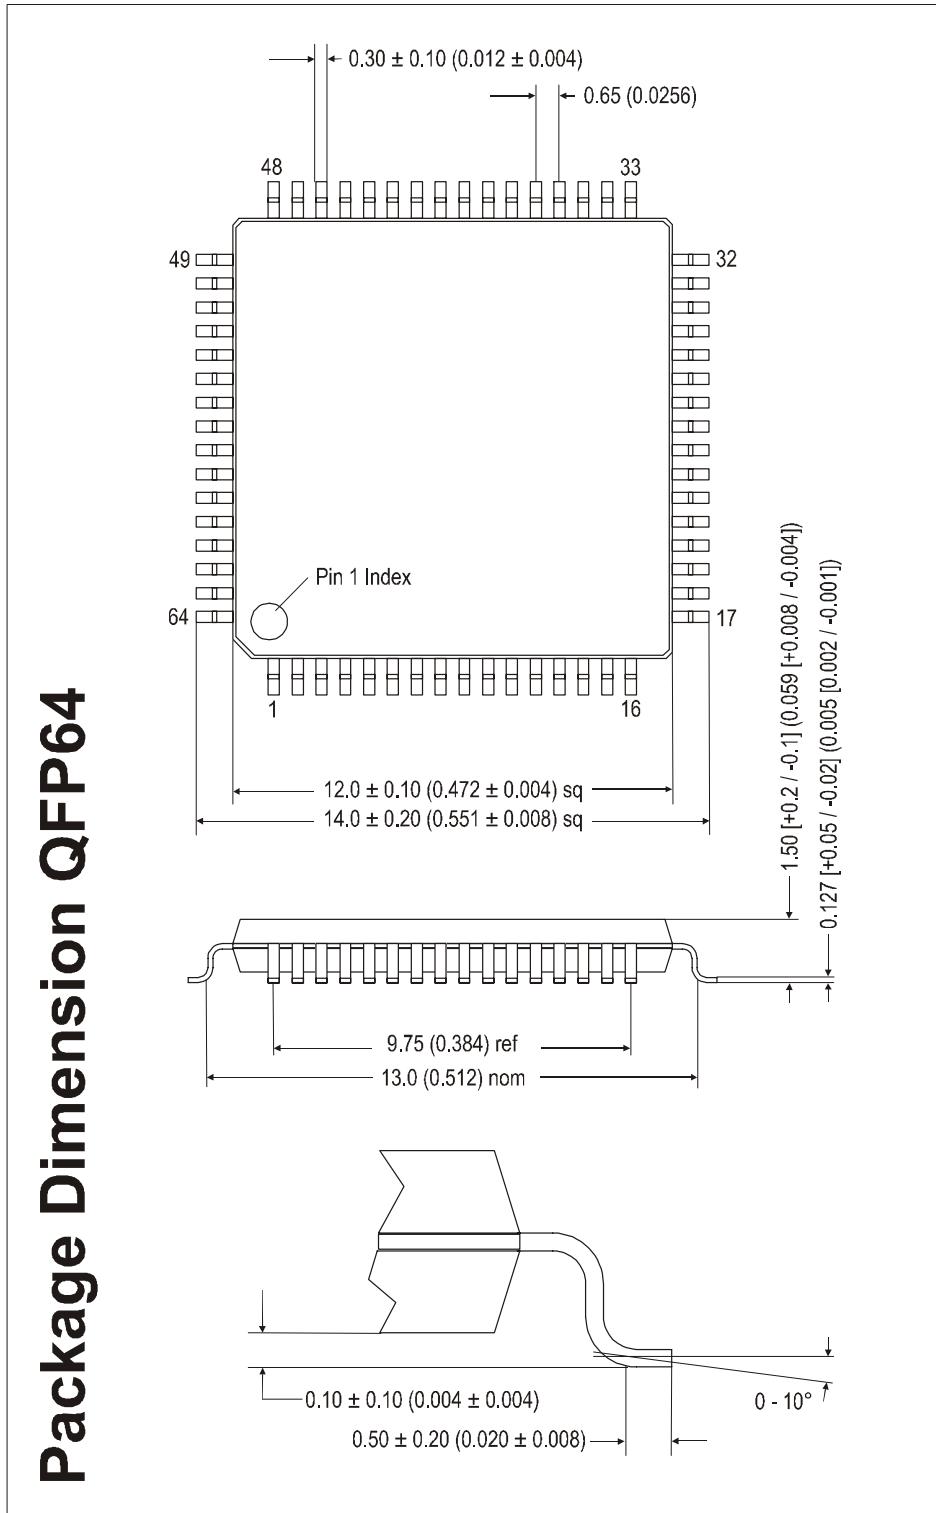

Stresses greater than those listed parameters may cause permanent damage to the device. Functional operation should be restricted to recommended operation conditions. Exposure to absolute maximum rating conditions for extended times may affect reliability.

Parameter	Symbol	Rated Value		Units	Remarks
		Min.	Max.		
Power supply voltage	VCC	VSS - 0.3	VSS + 6.0	V	
Analog power supply voltage	AVCC	VSS - 0.3	VCC	V	
Analog reference voltage	AVREF	VSS - 0.3	VCC	V	
Input voltage	Vi	VSS - 0.3	VSS + 6.0	V	Vi < VCC + 0.3V
Output voltage	Vo	VSS - 0.3	VSS + 6.0	V	Vo < VCC + 0.3V
L level maximum output current	IOLMAX		15	mA	Time < 20 msec
L level maximum output current	IOL		4	mA	
H level maximum output current	IOHMAX		15	mA	Time < 20 msec
H level maximum output current	IOH		4	mA	
Maximum Power dissipation	P _{MAX}		300	mW	
Operating temperature	T _A	-40	+85	°C	CO4011B
	T _A	-40	+105	°C	CO4011BE
Storing temperature	T _A	-55	+150	°C	

Recommended Operation Conditions and Characteristics

Functional operation should be restricted to recommended operation conditions.

Parameter	Symbol	Rated Value			Units	Remarks
		Min.	Typ.	Max.		
Power supply voltage	VCC	4.5	5.0	5.5	V	
Analog power supply voltage	AVCC		VCC	VCC	V	
Analog reference voltage	AVREF	3.0		VCC	V	
Power supply current	Icc		35	50	mA	All inputs V _{IL} or V _{IH} All outputs open
Input H voltage	V _{IH}	0.8 * VCC		VCC + 0.3	V	
Input L voltage	V _{IL}	VSS - 0.3		0.2 * VCC	V	
Output H voltage	V _{OH}	VCC - 0.5			V	I _{OH} = -4.0 mA
Output L voltage	V _{OL}			0.4	V	I _{OL} = 4.0 mA
Input leakage current	I _{LK} C	-5		5	uA	
Crystal frequency	f _{osc}		4		MHz	
Reset pulse width	t _{res}	10			us	
Power on rise time	t _{RESLH}	0.05		30	ms	
Maximum CANopen Delay input pin to bus telegram	t _{DITB}	0.05	0.5	2	ms	No additional bus distribution delay

Single Chip CANopen Controller for Remote I/O

Typical Application: EVA board for CO4011B

Differences between CO4011A and CO4011B

The CO4011B is an upgrade type for the CO4011A single chip CANopen remote I/O. It improves the functionality. For new designs it is recommended to use the new CO4011B device, however the CO4011A will not be removed from the product list.

For existing applications there are few changes, that might cause incompatibilities:

Changes until CO4011B-Version 1.11	Might cause incompatibility	Note
Additional operation mode: 16 digital inputs and 16 digital outputs	NO	
Setting of Node-ID using object 2100 changed	YES	
Default Value of object 2180 (restart after bus off changed)	YES	
Enhanced power down features, new object 2FF8	NO	
Emergency Message after Wake-Up From Power Down changed	YES	
Mode for not CANopen standard conforming PDO mapping procedure is not longer supported (See CFG-Pin CFG3)	YES	
Boot-Up procedure improved	NO	
Boot up with no other connected CAN-device does not force the output pins to their error levels.	NO	
If the devices detects a changed configuration bitmap at input pins CFG0..CFG3 a previously stored object dictionary is cleared and the chip resumes to default settings.	NO	

Version History and Notes

The following table shows all relevant changes of the CO4011B. during product life time.

Version	Date	Changes
1.11	July/14/2003	
1.20	Okt/10/2003	New Obj. 2002 (Application Information object) New Obj. 1010.02..1010.04 enables saving of object 2002. New Configuration-Mode supporting 8 dig. Inputs and 8 dig. Outputs.
1.20 Rev0.1	May/12/2004	Documentation: Description of Object 2002 changed
1.23	Nov/21/2003	BugFix Writing of Strings with length < 5 using SDO corrected New Error-Input pin debounced
1.41	Okt/27/2005	New For String Download with SDO the string length is checked now Change Power Down Mode : Wake up from power down : RPDI is checked even if a wake up is initiated but not confirmed at pin WUII BugFix Baudrate 10 kHz is working now. BugFix A node guarding remote frame will only start the guarding process if a life time greater than zero is set before the node receives the Remote frame.
1.60	Dez/14/2007	New Interrupt feature on digital input pins added. New objects 5800 .. 5803

Attention please !
