R858 Series

1.0 Hz to 102.4 kHz 8-Bit Programmable

2" x 4" Range Switch 8-Pole Filters

Description

The R858 Series are digitally programmable, 8-pole low-pass and high-pass active filters that contain a low and a high programmable frequency range, with each range tunable over a 256:1 ratio. R858 filters are available with any two of five standard factory-set tuning ranges or 8-bit custom ranges from 1.0 Hz to 102.4 kHz. These units contain 8 CMOS logic inputs that can be operated in a transparent or latching mode and 1 logic input for range selection.

All R858 Series models are convenient, easy to use, fully finished filters which require no external components or adjustments. They feature low harmonic distortion, and precision phase and amplitude characteristics. R858 filters operate from non-critical ±12 to ±18 Vdc power supplies, have a 10 kΩ (min.) input impedance, a 10 Ω (max.) output impedance.

Features/Benefits:

- Low harmonic distortion and wide signal-to-noise ratio to 16 bit resolution.
- Digitally programmable corner frequency allows selecting cut-off frequencies specific to each application.
- Plug-in ready-to-use, reducing engineering design and manufacturing cycle time.
- Factory-set tuning range, no external clocks or adjustments needed.
- Broad range of transfer characteristics and corner frequencies to meet a wide range of applications.

Applications

- Anti-alias filtering
- Data acquisition systems
- Communication systems and electronics
- Medical electronics equipment and research
- Aerospace, navigation and sonar applications
- Sound and vibration testing
- Real and compressed time data analysis
- Noise elimination
- Signal reconstruction

8-Bit Programmable Filters

Digital Tuning & Control Characteristics

Digital Tuning Characteristics

The digital tuning interface circuits are two 4042 quad CMOS latches which accept the following CMOS-compatible inputs: eight tuning bits (D_0 - D_7), arrange selection bit (R), a latch strobe bit (C), and a transition polarity bit (P).

Filter tuning follows the tuning equation given below:

$$f_c = (f_{max}/256) [1 + D_7 \times 2^7 + D_6 \times 2^6 + D_5 \times 2^5 + D_4 \times 2^4 + D_3 \times 2^3 + D_2 \times 2^2 + D_1 \times 2^1 + D_0 \times 2^0]$$

where D_1 - D_7 = "0" or "1", and
f_{max} = Maximum tuning frequency;
f_c = corner frequency;
Minimum tunable frequency = $f_{max}/256$ (D_0 thru D_7 = 0);
Minimum frequency step (Resolution) = $f_{max}/256$

Data Input Specifications

Data Control Lines

Functions	Latch Strobe (C)
	Transition Polarity (P)

Data Control Modes

Mode 1	P = 0; C = 0	frequency follows input codes
	P = 0; C = 0⇑	frequency latched on rising edge
Mode 2	P = 1; C = 1	frequency follows input codes
	P = 1; C = 1⇓	frequency latched on falling edge

Input Data Levels **(CMOS Logic)**

Input Voltage (Vs = 15 Vdc)		
Low Level In	0 Vdc min.	4 Vdc max.
High Level In	11 Vdc min.	15 Vdc max.
Input Current		
High Level In	-10^{-5} µA typ.	-1 µA max..
Low Level In	$+10^{-5}$ µA typ.	+1 µA max.
Input Capacitance	5 pF typ	7.5 pF max.
Latch Response		
Data Set Up Time[1]	25 nS	
Data Hold Time[2]	50 nS	
Strobe Pulse Width	80 nS min.	

Input Data Format **Frequency Select Bits**

Positive Logic	Logic "1" = +Vs
	Logic "0" = Gnd
Bit Weighting	(Binary-Coded)
D_0	LSB (least significant bit)
D_7	MSB (most significant bit)
Frequency Range	256 : 1, Binary Weighted

Notes:
1. Frequency data must be present before occurrence of strobe edge.
2. Frequency data must be present after occurrence of strobe edge.

Pin-Out Key

IN	Analog Input Signal	D_7 Tuning Bit 7 (MSB)
OUT	Analog Output Signal	D_6 Tuning Bit 6
GND	Power and Signal Return	D_5 Tuning Bit 5
"P"	Transition Polarity Bit	D_4 Tuning Bit 4
"C"	Tuning Strobe Bit	D_3 Tuning Bit 3
+Vs	Supply Voltage, Positive	D_2 Tuning Bit 2
-Vs	Supply Voltage, Negative	D_1 Tuning Bit 1
Os	Offset Adjustment	D_0 Tuning Bit 0 (LSB)
R	Range Switch Adjustment

FREQUENCY DEVICES™, INC.

Product Handling Procedure

Programmable Filter Modules Power Sequence & ESD

November 2000

Programmable Filters Modules

818, 824, 828, 828BP, 828BR, 854, 858, R854, R858

I. Scope

The following precautions are necessary when handling and installing Frequency Devices programmable filter modules.

II. Digital Circuit Description

The digital input pins connect directly to 4000 series CMOS logic, such as the 4053 analog switch. The power supply (Vss) for the digital logic on the module comes directly from the +15 Volt pin on the module. This sets the threshold voltage at 11.0 V minimum to 15.0 V maximum for a "1" (High) level and 0.0 V minimum to 4.0 V maximum for a "0" (Low) level. Applying a voltage between 4.0 and 11.0 V will produce unpredictable operation. Connecting 5 Volt or 3.3 V logic devices directly to the filter module without using a voltage translator will result in erratic operation of the filter.

III. (VERY IMPORTANT) Power-Up and Power-Down Sequence

Do not plug-in or un-plug module while power is applied. It is imperative that power is supplied to the + 15 V pin on the filter module before or at the same instance that any digital pin is pulled High (> 0.0 V). Failure to do this will result in excessive current flowing through the digital input pin and through a protection diode internal to the 4000 logic, which will result in damage to the module. The proper power-up and power-down sequence is:

1. Connect filter module ground.
2. Connect filter module +15 V.
3. Connect filter module -15 V.
4. Connect the input signal.

All four of the above steps can also occur simultaneously. Power-down should occur in the reverse order.

IV. ESD Issues

Like most modern electronic equipment, the modules can be damaged by electrostatic discharge (ESD). The modules are shipped from the factory in sealed, anti-static packaging and should be kept in the sealed package prior to mounting on a circuit board. The following additional rules should also be observed when handling the modules after they are removed from the factory packaging:

1. Only a person wearing a properly grounded wrist strap should handle the modules.
2. Any work surface that the modules are placed on must be properly ESD grounded.
3. Any insulating materials capable of generating static charge (such as paper) should be kept away from the modules.

Static generating clothing should be covered with an ESD-protective smock.

1.**Normalized Group Delay:**
The above delay data is normalized to a corner frequency of 1.0Hz.The actual delay is the normalized delay divided by the actual corner frequency (fc).

$$\text{Actual Delay} = \frac{\text{Normalized Delay}}{\text{Actual Corner Frequency (fc) in Hz}}$$
