\*: The output average power when the amplifier is playing music can be considered roughly 1/10 of the maximum output power. So it is useful to consider the dissipated power in this condition for thermal dimensioning.

\*\* $P_O$  = measured across the load using the following inductor:  
COIL 58120 MPPA2 (magnetics)    TURNS: 28  $\varnothing$  1mm  
COIL77120 KOOL M $\mu$  (magnetics)    TURNS: 28  $\varnothing$  1mm

\*\*\*: The zero-signal switching frequency can be obtained using the following expression:  $F_{SW} = B_F/R_F$

\*\*\*\*: The maximum value of  $R_F$  is related to the maximum possible value for the voltage drop on  $R_F$  itself.

(1): For  $V_{12} > 5.2V$ , an input impedance of  $10K\Omega$  is to be considered.
