### Define Your Power Requirements

Define your system input and output requirements. You can build a system from scratch, or you can choose from over 250 templates covering popular FPGA platforms such as Xilinx, Altera (now Intel), Lattice, and Microsemi/Actel.

### Select Parts

Once you've got your rails identified, suggested parts are just a click away—including both single output devices, and dual devices that could serve more than one output. You can choose as many parts as you'd like to compare.

### Summary Analysis

To help you finalize part selections, the app looks at the efficiency data across your specified output operational range, and presents system cost and graphs showing the system efficiency, power dissipation and junction temperature.

### Generate Reference Designs

For schematic-enabled parts, you can generate customized reference design files to get a BOM and a set of base schematics with all the associated blocks connected together—simplifying your design effort.
