## KELLER's latest venture: the "H2O" website for the water industry

KELLER AG develops and creates pressure measurement technology for all manner of different applications. Alongside oil and gas, aeronautics, aviation and the automotive sector, water is another key industry – reason enough to give it its own dedicated website built around real-life examples. The new website showcases a range of potential solutions and explores how customers from the water industry have successfully put them into practice thanks to their partnership with KELLER.

KELLER AG für Druckmesstechnik designs and manufactures equipment including remote transmitters, level sensors and data loggers for the water industry. As well as providing a comprehensive overview, the various case studies also illustrate how KELLER works together with its customers in a straightforward and mutually beneficial way to produce solutions that, above all else, are extremely durable and excellent value for money.

A clear and fresh design makes it easy to find your way around the site, which is arranged into the four main areas of water supply, wastewater, groundwater and surface water. The case studies are complemented by a list of all products that helped make the project in question a success. Each is linked to the corresponding standard product on KELLER's main website. Is that what you're looking for, only with modified electronics and a different housing? No problem! Most products are available in several designs and with different levels of functionality, while customised versions can also be made to order.

The new water website can also be browsed easily when out and about. It adjusts itself automatically to the screen resolution on your mobile device, making it simple and clear to navigate on the go too. Discover the benefits of the "H2O" website for yourself at [www.keller-H2O.com](http://www.keller-H2O.com).
