INTRODUCTION

The UT54BS3245 provides 8 bits of high-speed CMOS-compatible bus switching. The low on-state resistance of the switch allows connections to be made with minimal propagation delay. The device is organized as one 8-bit low-impedance switch. When output enable (/EN) is low, the 8-bit bus switch is on and port A is connected to port B. When /EN is high, the switch is open and a high-impedance state exists between the two ports.
