Introduction to Fluorescence Recovery after Photobleaching (FRAP)

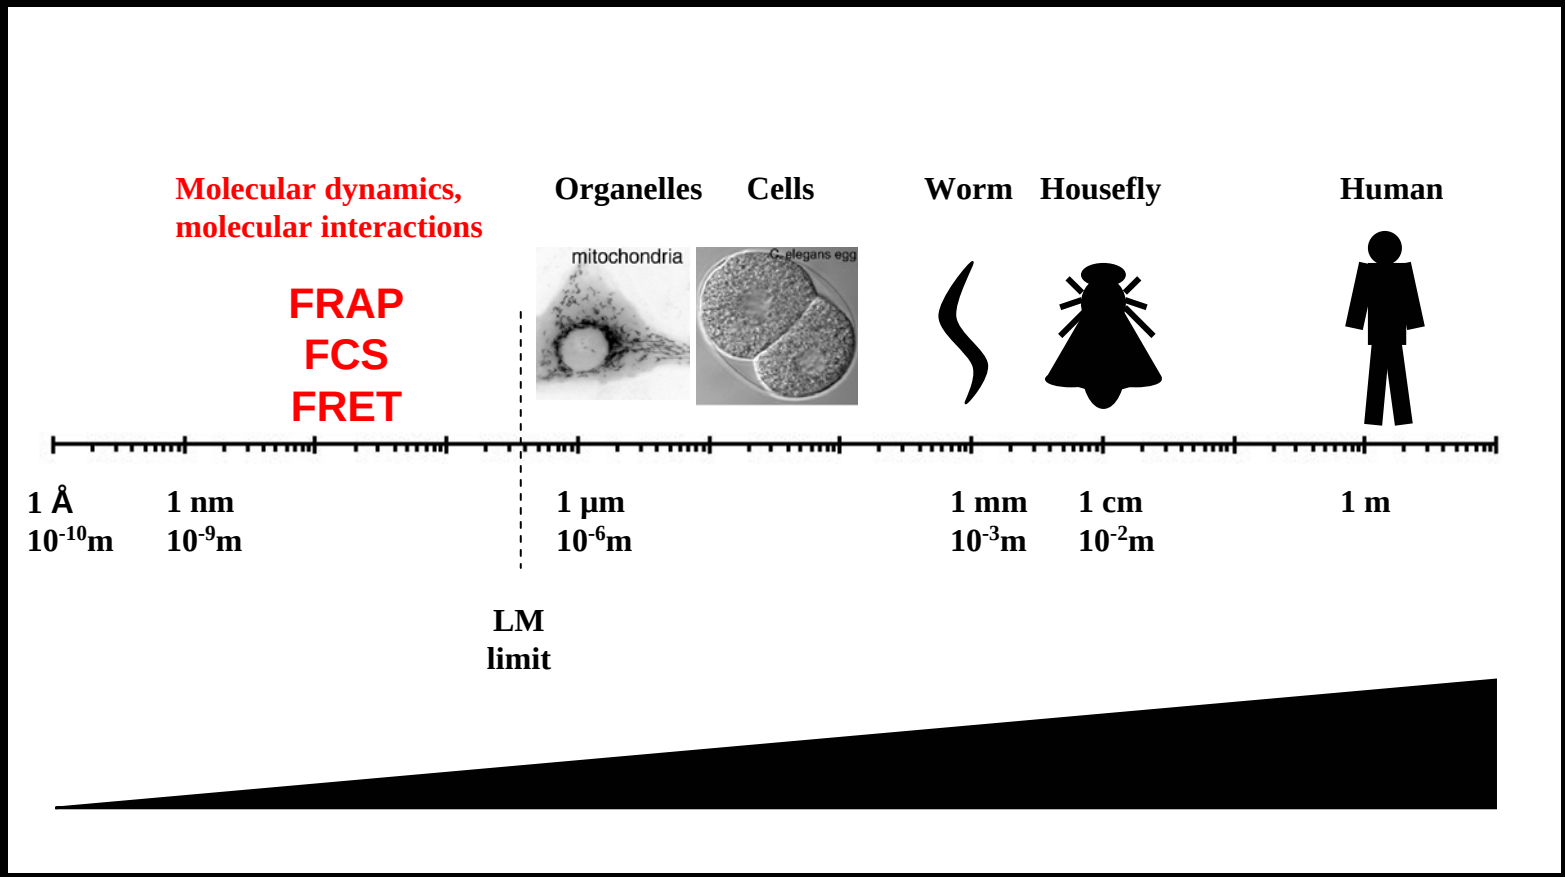
Timo Zimmermann, Advanced Light Microscopy Facility
European Molecular Biology Laboratory, Heidelberg

http://www.embl-heidelberg.de/almf/

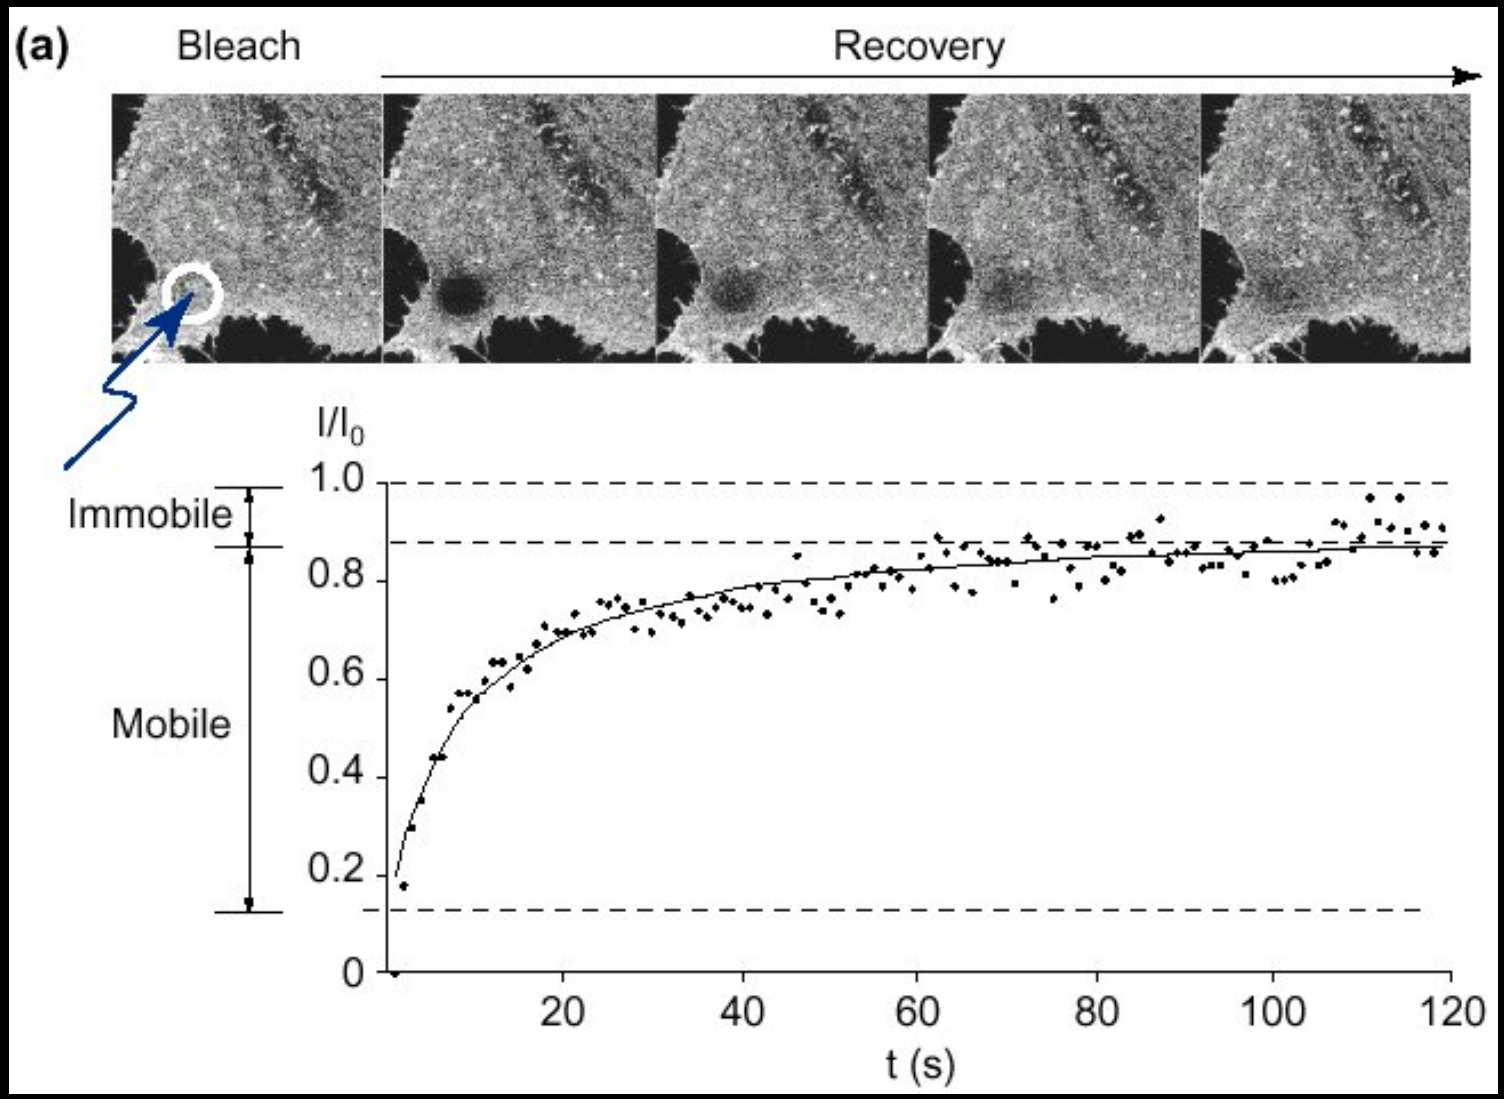
Overview

1) Introduction
2) FRAP principles
3) FRAP data analysis
4) Related techniques (FLIP, FLAP, Photoactivation, -conversion
5) Possible limitations
6) New technology developments

Resolution limit $R = \frac{\lambda}{2n (\sin \theta)}$



Fluorescence Recovery after Photobleaching (FRAP)



Bastiaens and Pepperkok (2000), TIBS 25/12

Timeline

1973: 1st application of the FRAP method (Poo and Cone)

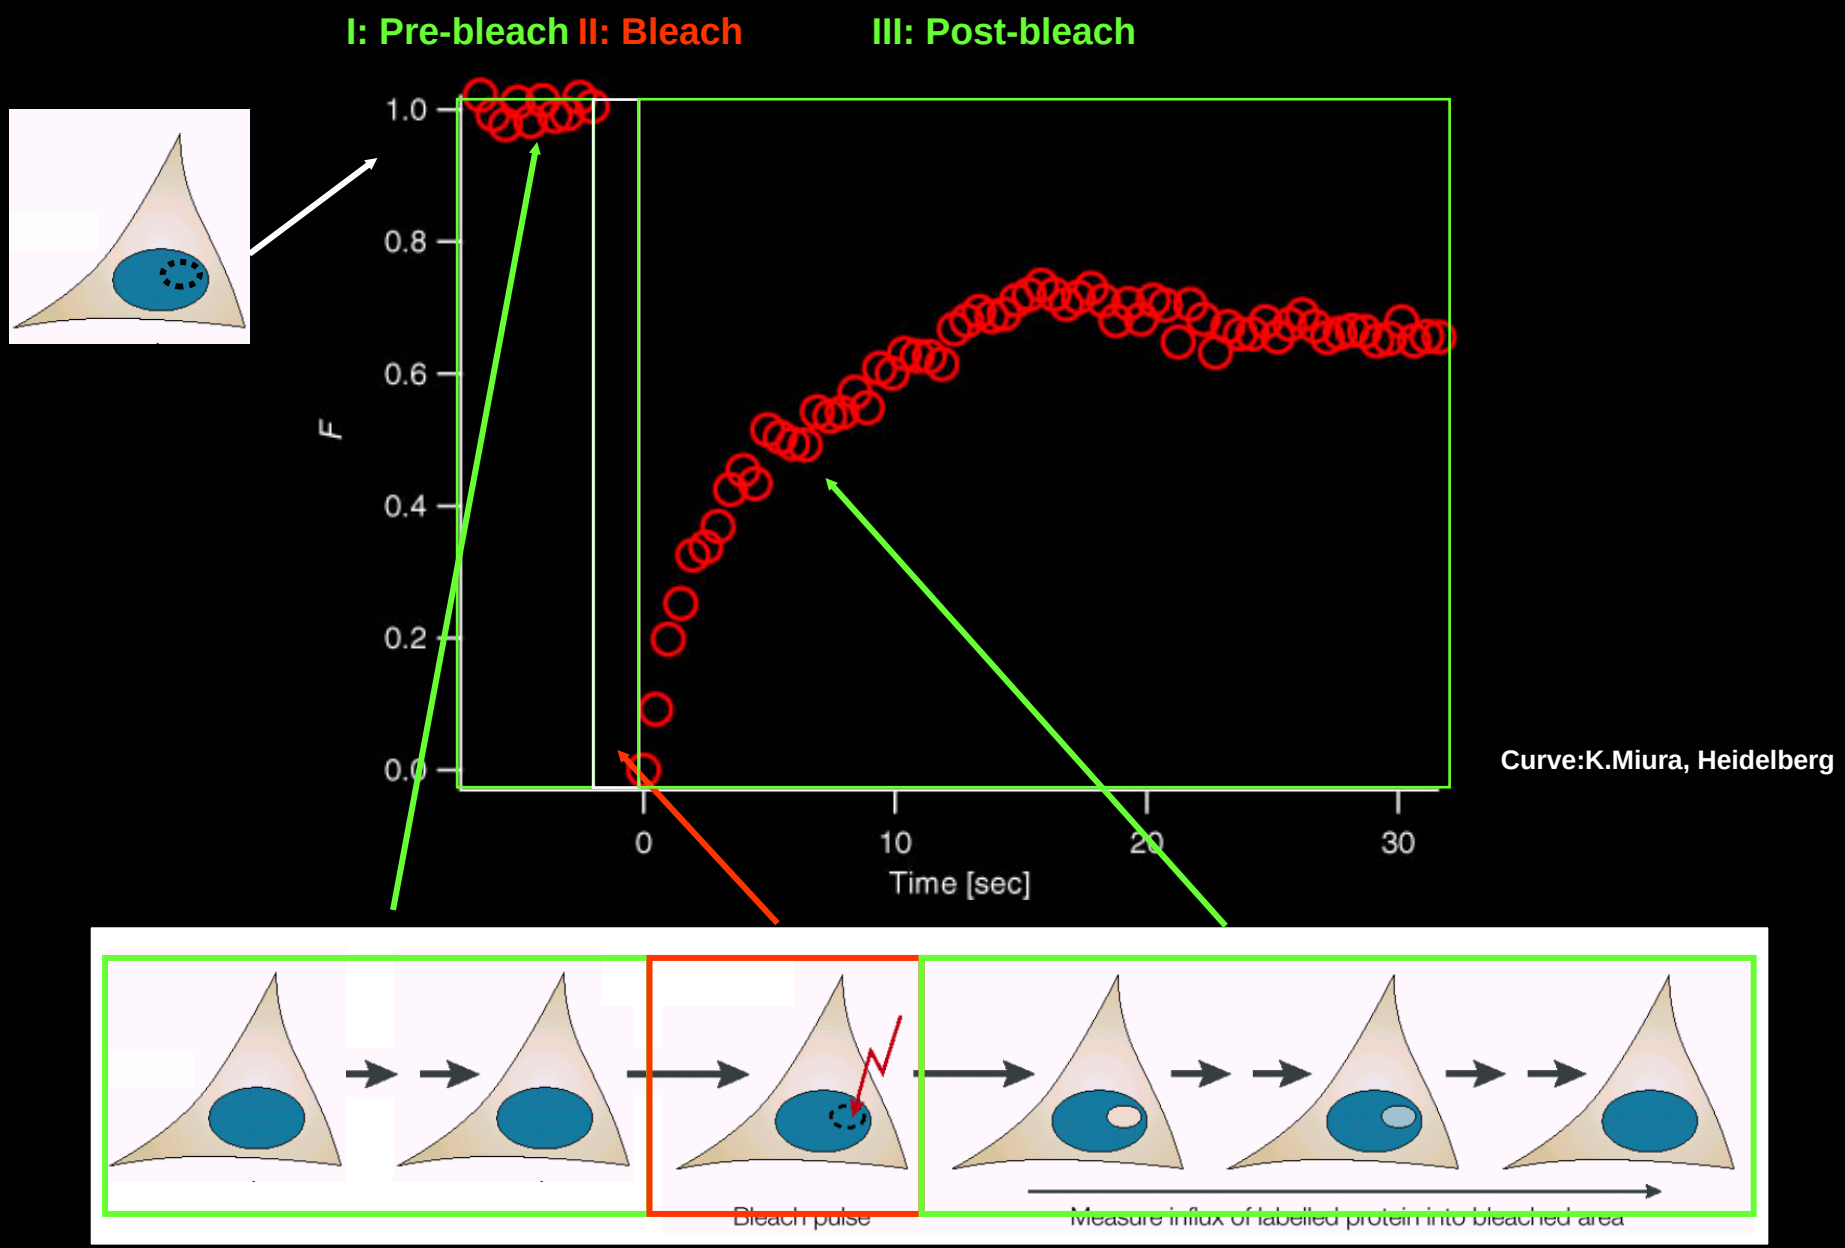
1976: Mathematics for quantitative FRAP of focused laser spots in two dimensions (Axelrod et al.)

1996: Resurrection of FRAP using GFP and confocal microscopes (Cole et al., Lippincott-Schwartz..)

Overview

1) Introduction
2) FRAP principles
3) FRAP data analysis
4) Related techniques (FLIP, FLAP, Photoactivation, -conversion
5) Possible limitations
6) New technology developments

Schematic of a FRAP experiment



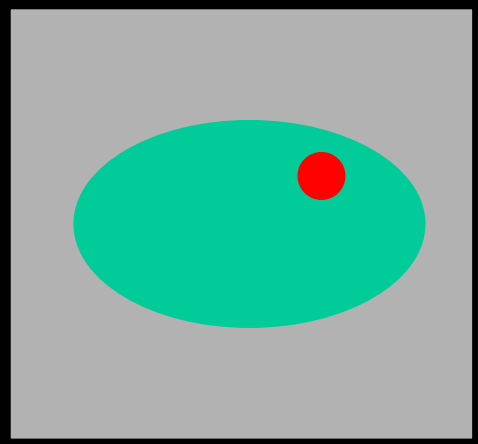
Execution of a FRAP experiment

1) Take a series of images before bleach (same settings as after the bleach)
2) Apply short local bleach
3) Take images after bleach until the recovery in the bleached area reaches a plateau

Intensity of bleaching light

AOTF upregulation (0-100%):

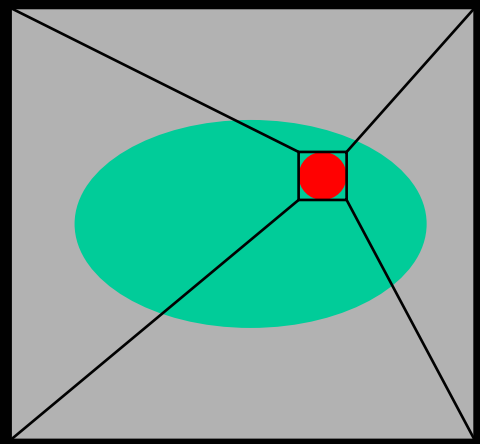
Linear



Zoom In:

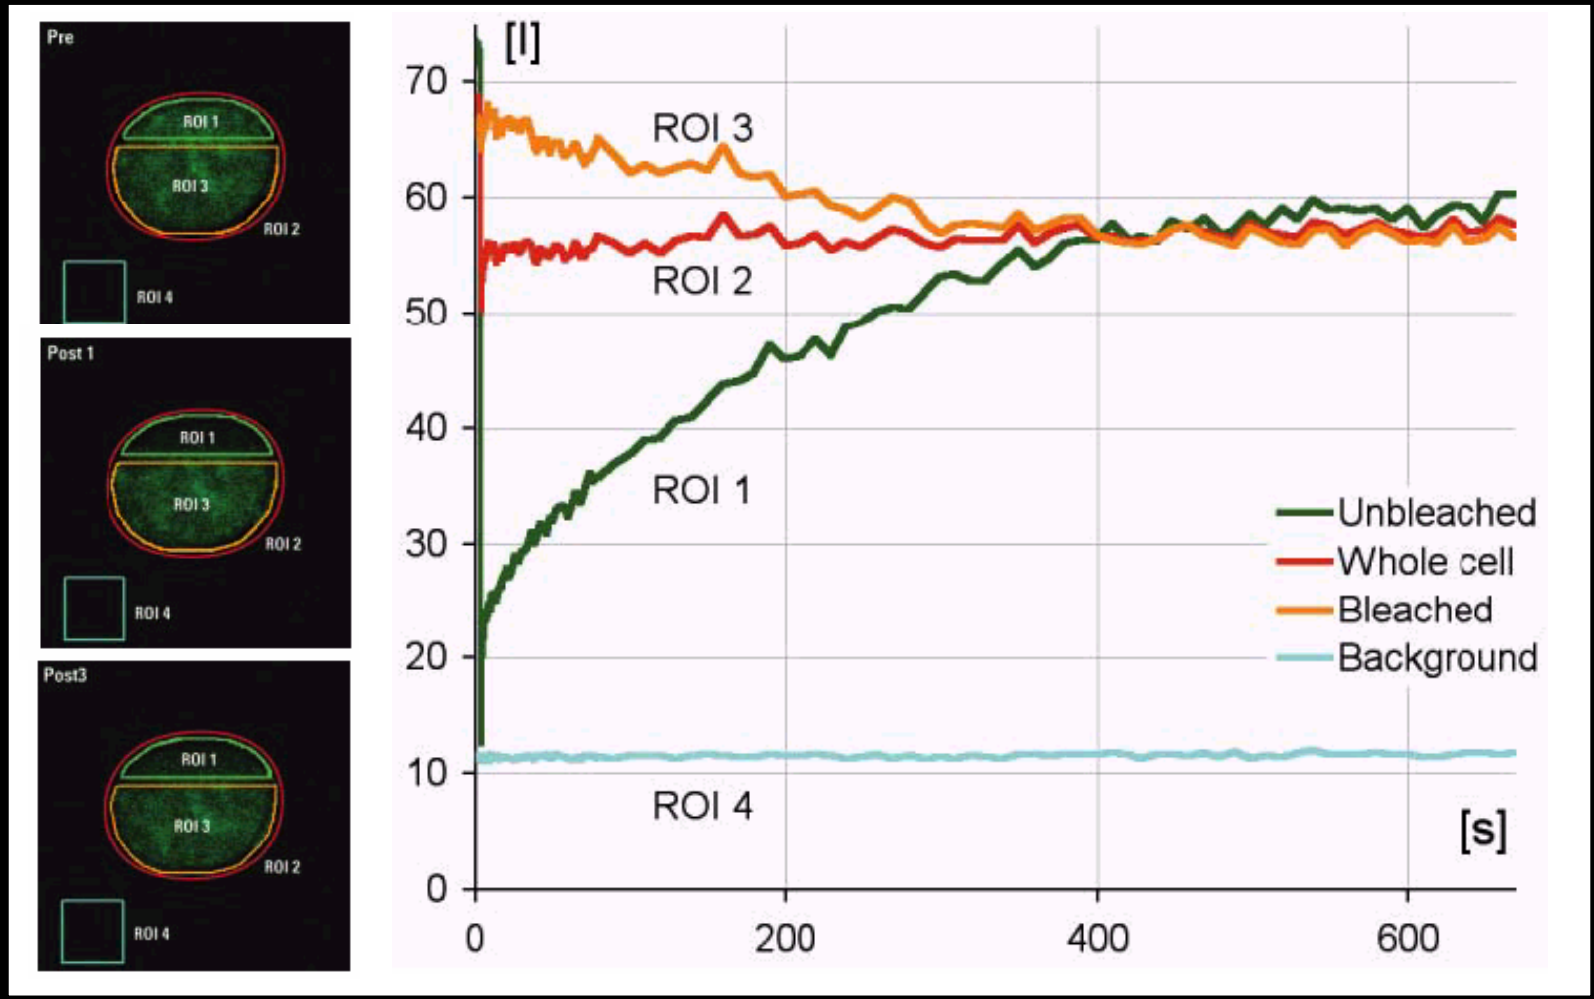
Exponential

$2^{zoomfactor}$



Speed limitation due to switching of the scanfield

FRAP experimental data



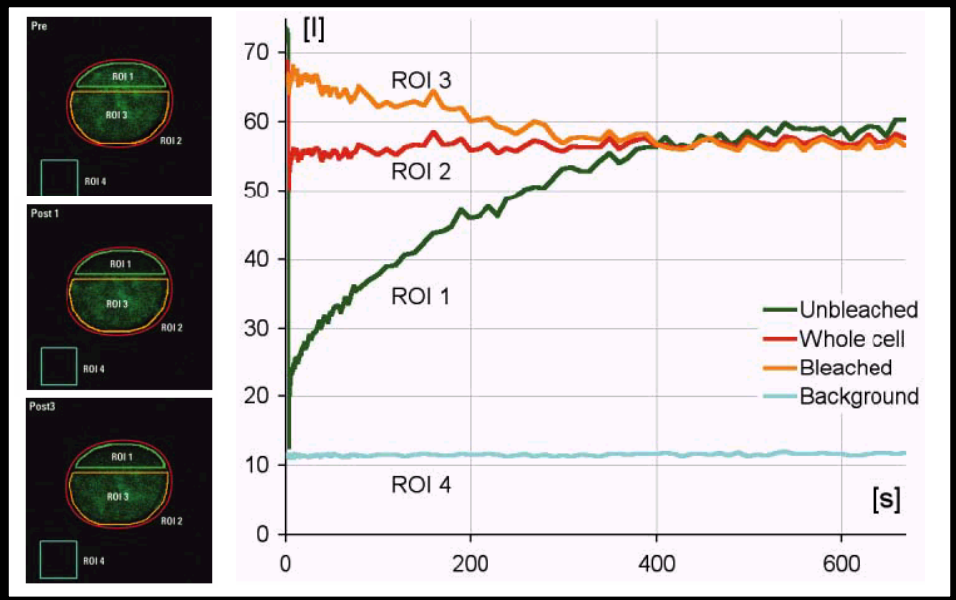
Kappel and Eils, Leica App.Letter 2004

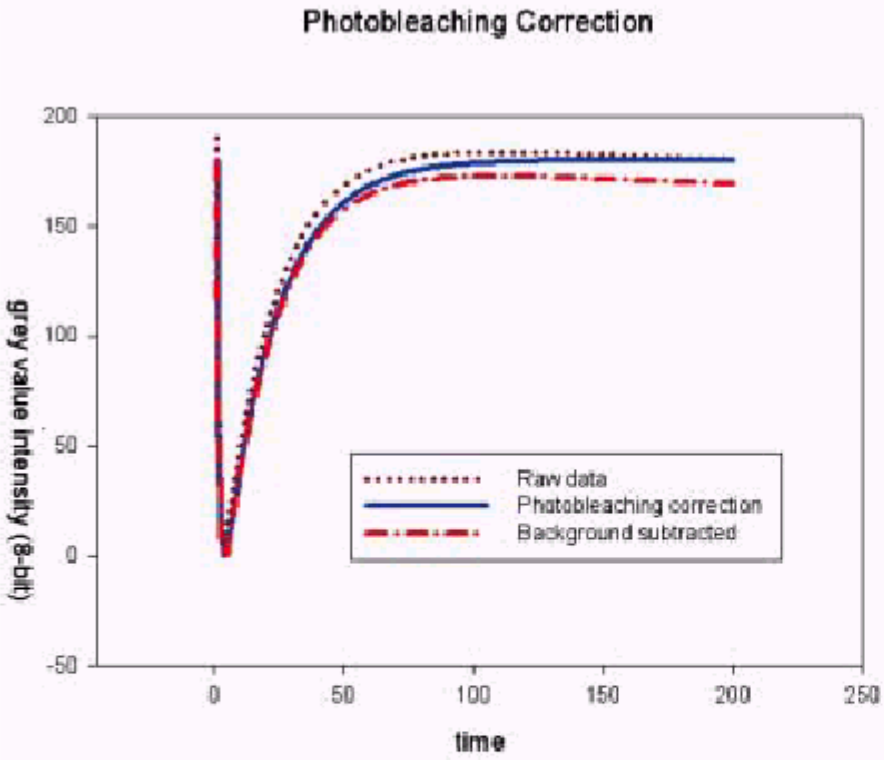
Overview

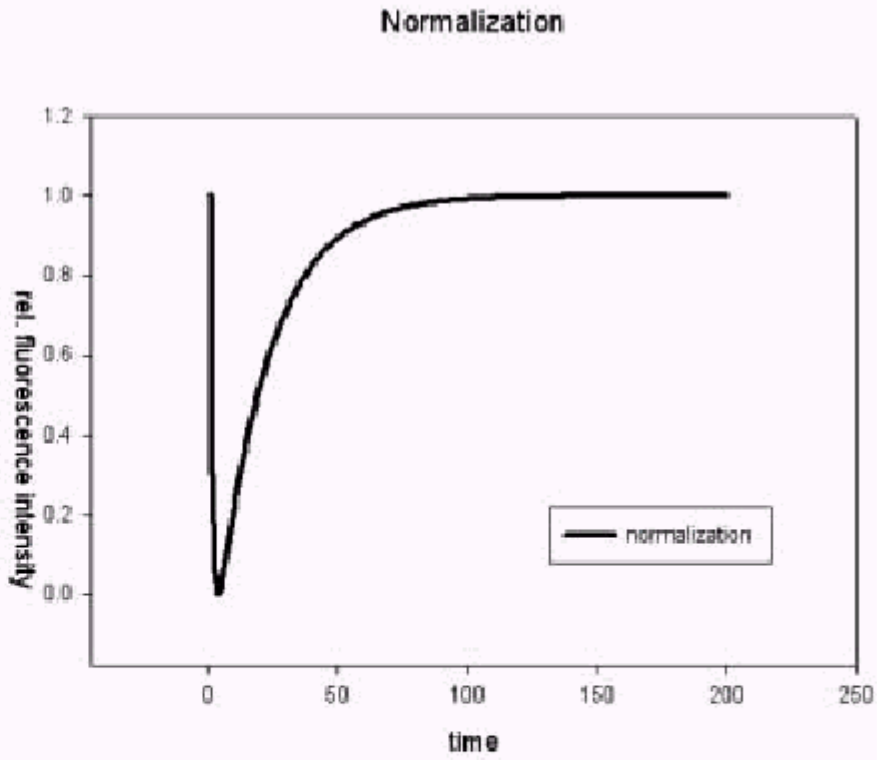
1) Introduction
2) FRAP principles
3) FRAP data analysis
4) Related techniques (FLIP, FLAP, Photoactivation, -conversion
5) Possible limitations
6) New technology developments

Correction of the experimental data

1) Background subtraction
2) Correction for photobleaching during the measurement (whole cell or neighboring cell as reference)
3) Data normalization (alternative methods)







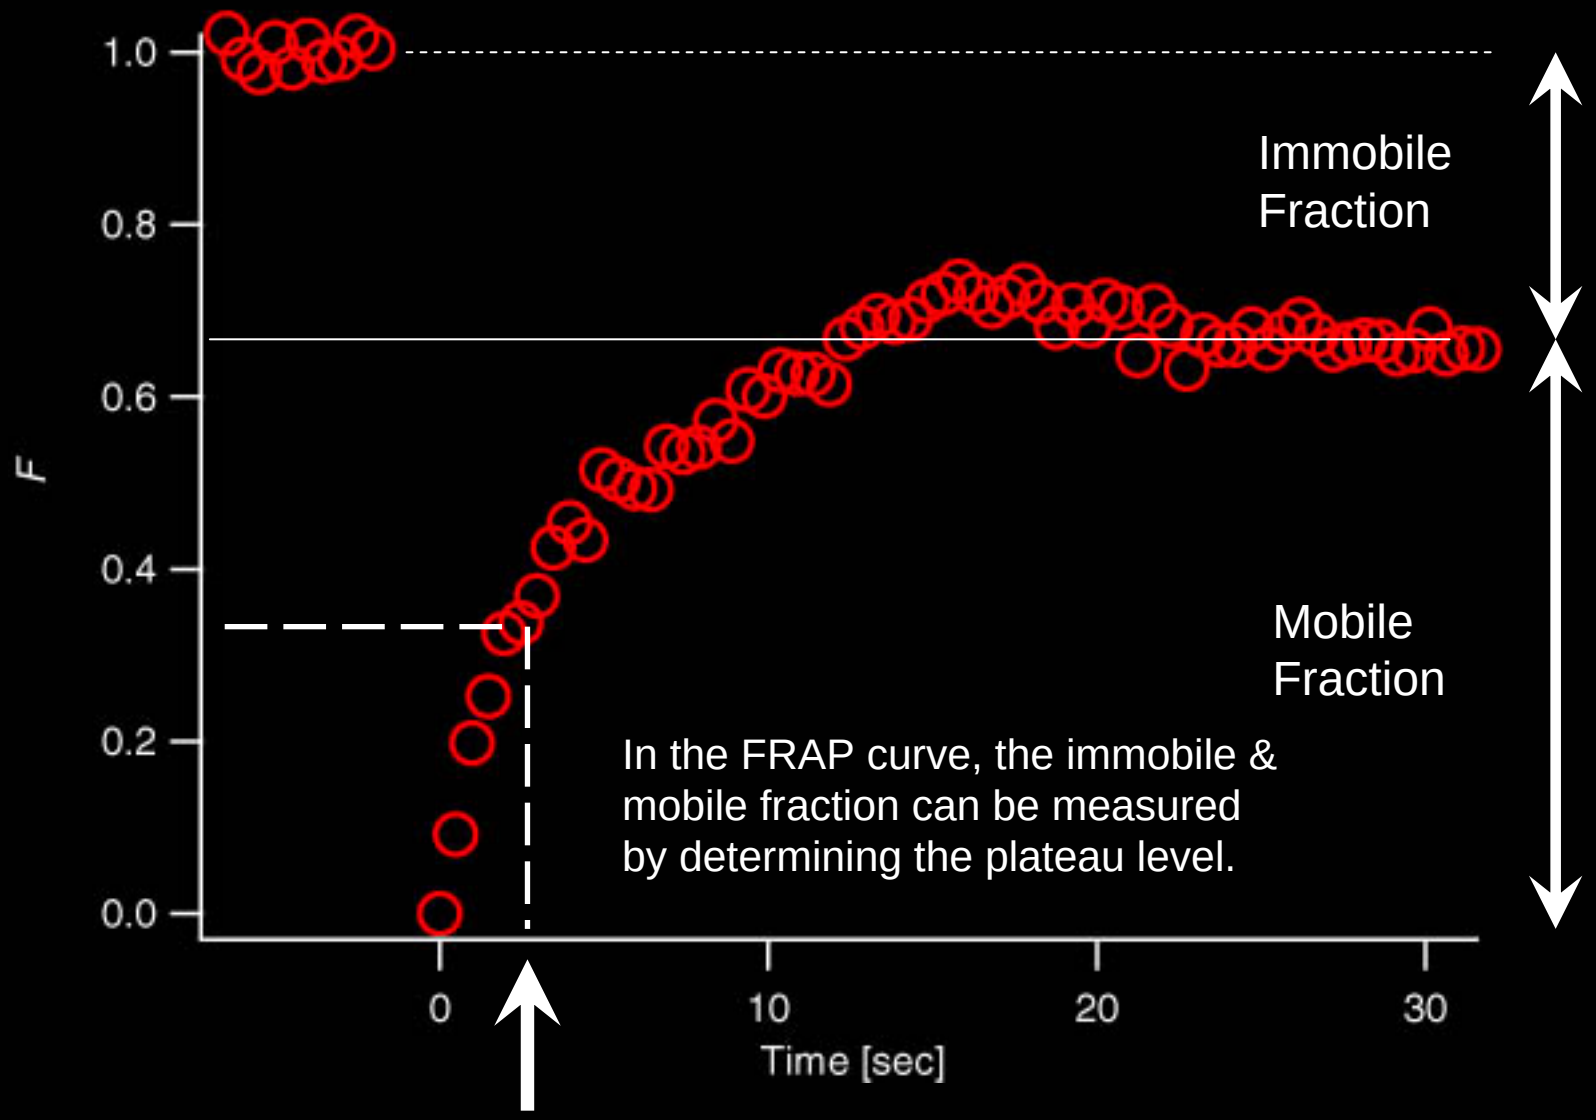
$$F_b = F(t) - background$$

$$F_{b,corr,normAxelrod}(t) = \frac{F_{b,corr}(t) - F_{b,corr}(0)}{F_{b,corr}(inf) - F_{b,corr}(0)}$$

$$F_{b,corr}(t) = F_b(t)\frac{F_{precell}}{F_{infcell}}$$

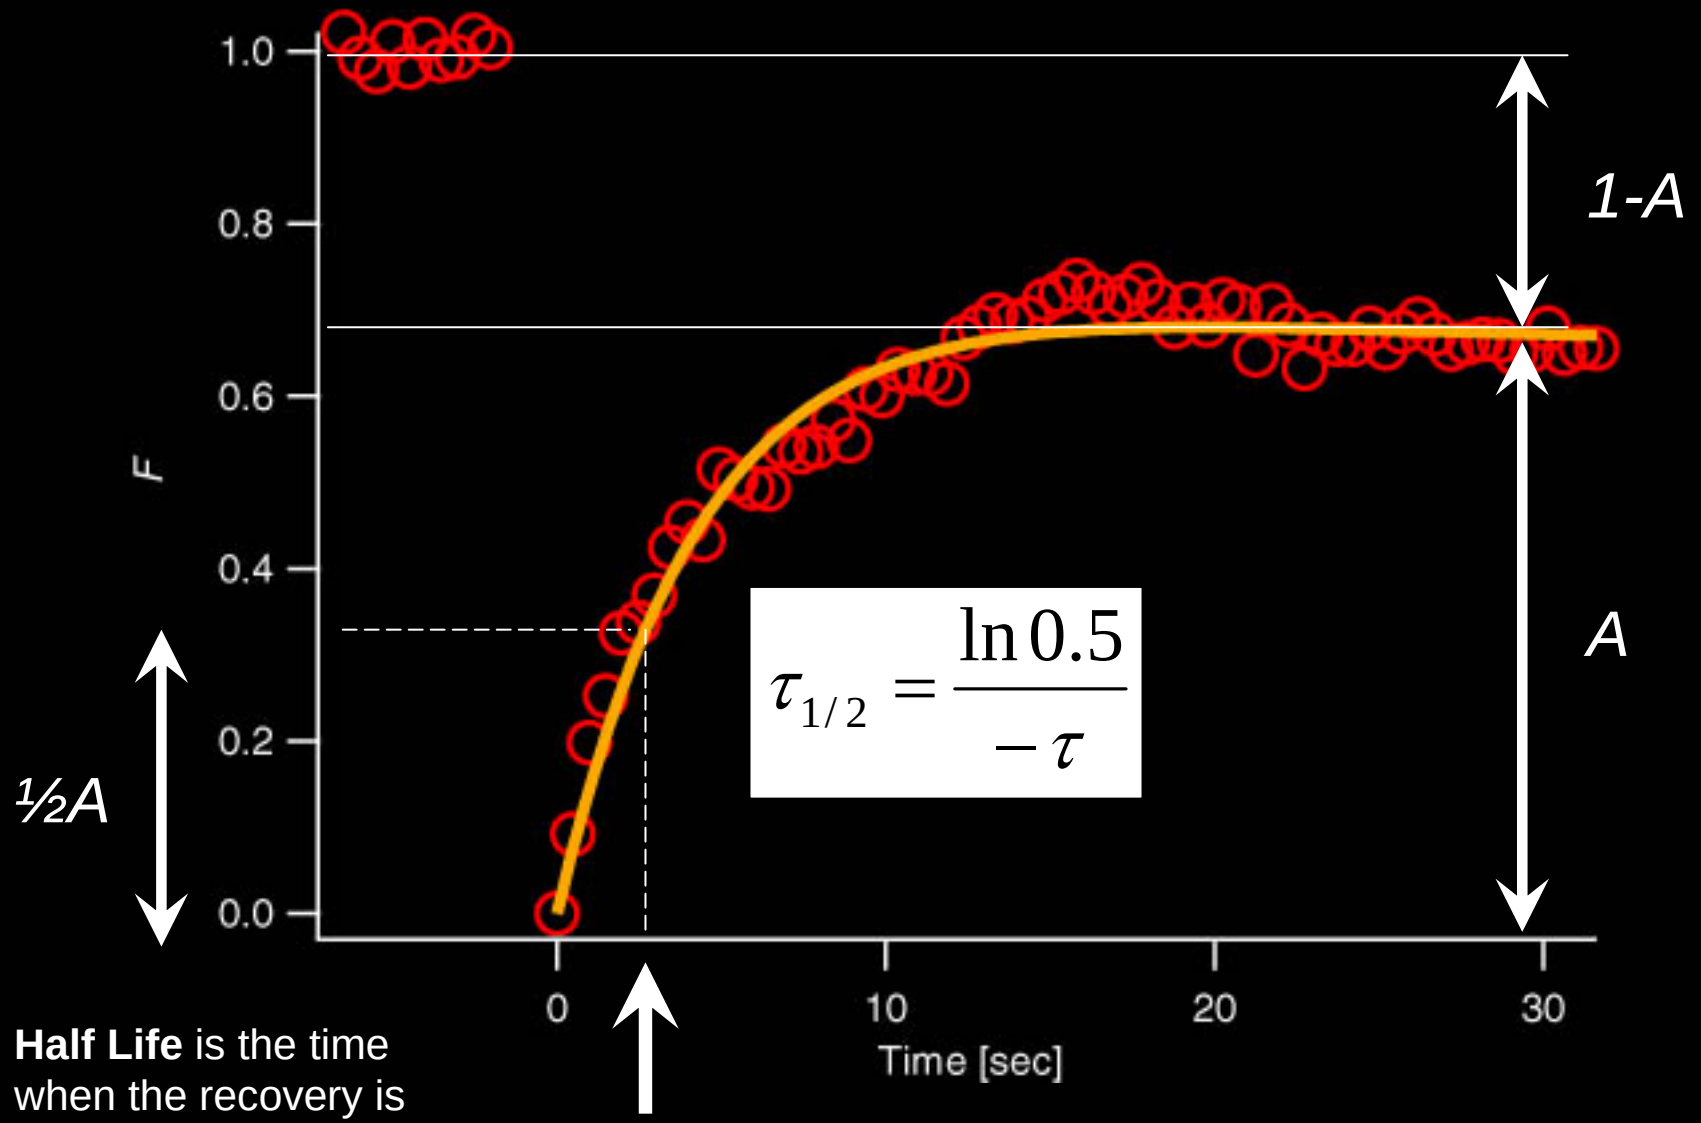
Kappel and Eils, Leica App.Letter 2004

The time constant and mobile / immobile fractions



Slide:K.Miura, Heidelberg

Curve Fitting $f(t) = A\left(1 - e^{-\tau t}\right)$



Half Life is the time when the recovery is the half of A, by definition.

Half Life ($\tau_{1/2}$)

Slide:K.Miura, Heidelberg

Estimated parameters by exponential fit:

1) **Mobile and immobile fraction**
2) **Recovery half-time**

Estimation of diffusion coefficient (Axelrod et al.)

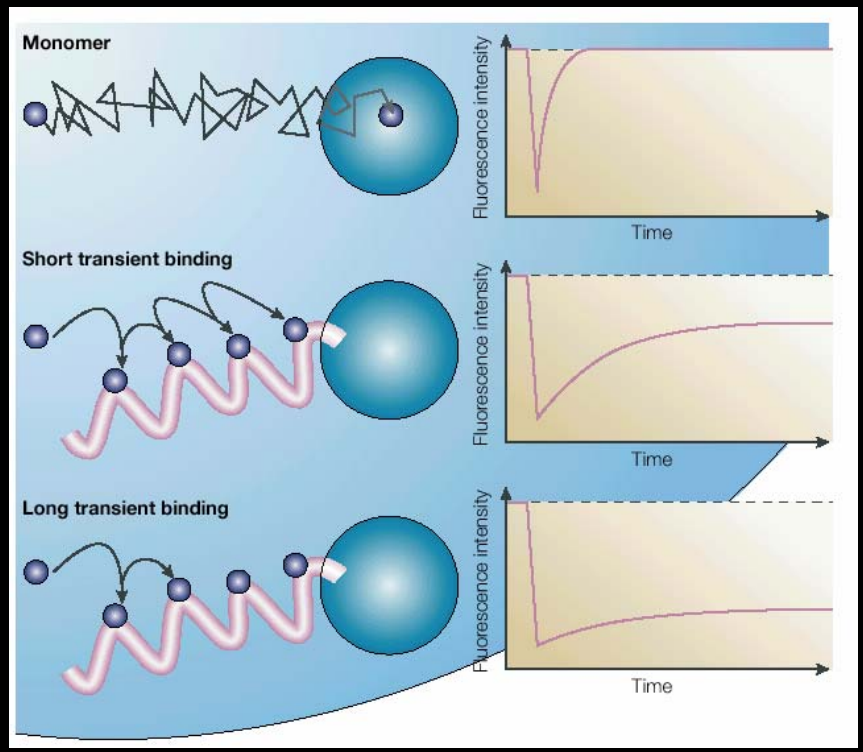
$$D = 0.88^{*} w^{2}/(4\, t_{1/2})$$

w: bleach radius

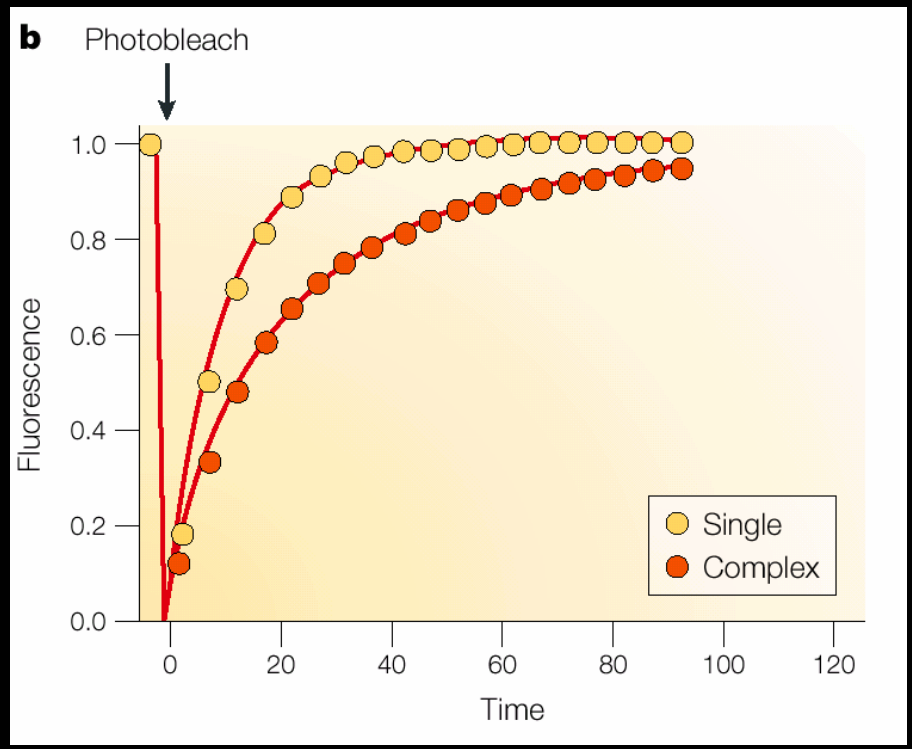
Assumptions:

- **bleached area is disk shaped**
- **diffusion occurs only in 2D**

Free diffusion vs. binding



Phair and Mistelli, Nature Reviews MolCellBio, 2001

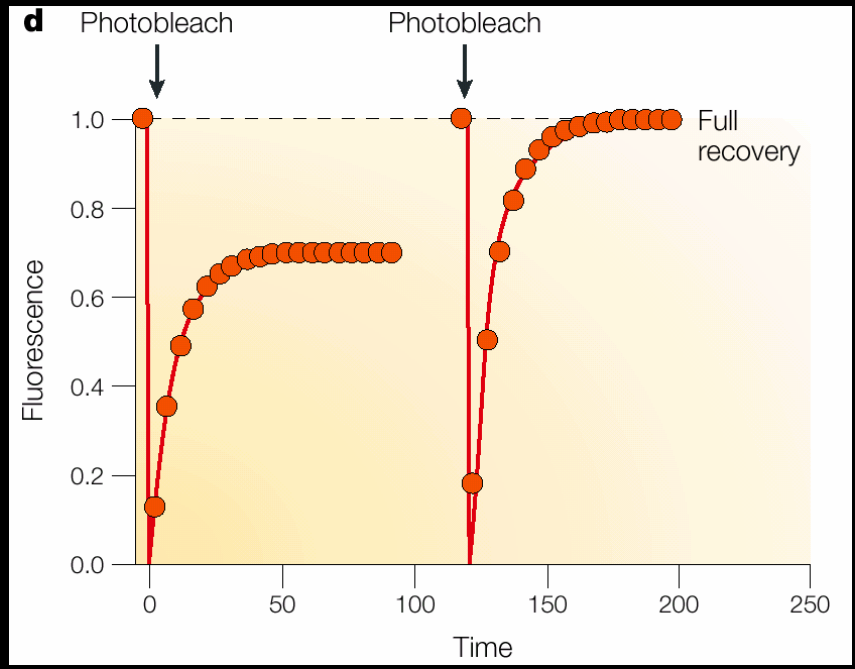


Lippincott-Schwartz et al. Nature CellBio Supp. 2003

Multiple populations with differing diffusion rates => multi-component equations

Possible FRAP artifacts

Photo-induced immobile fraction



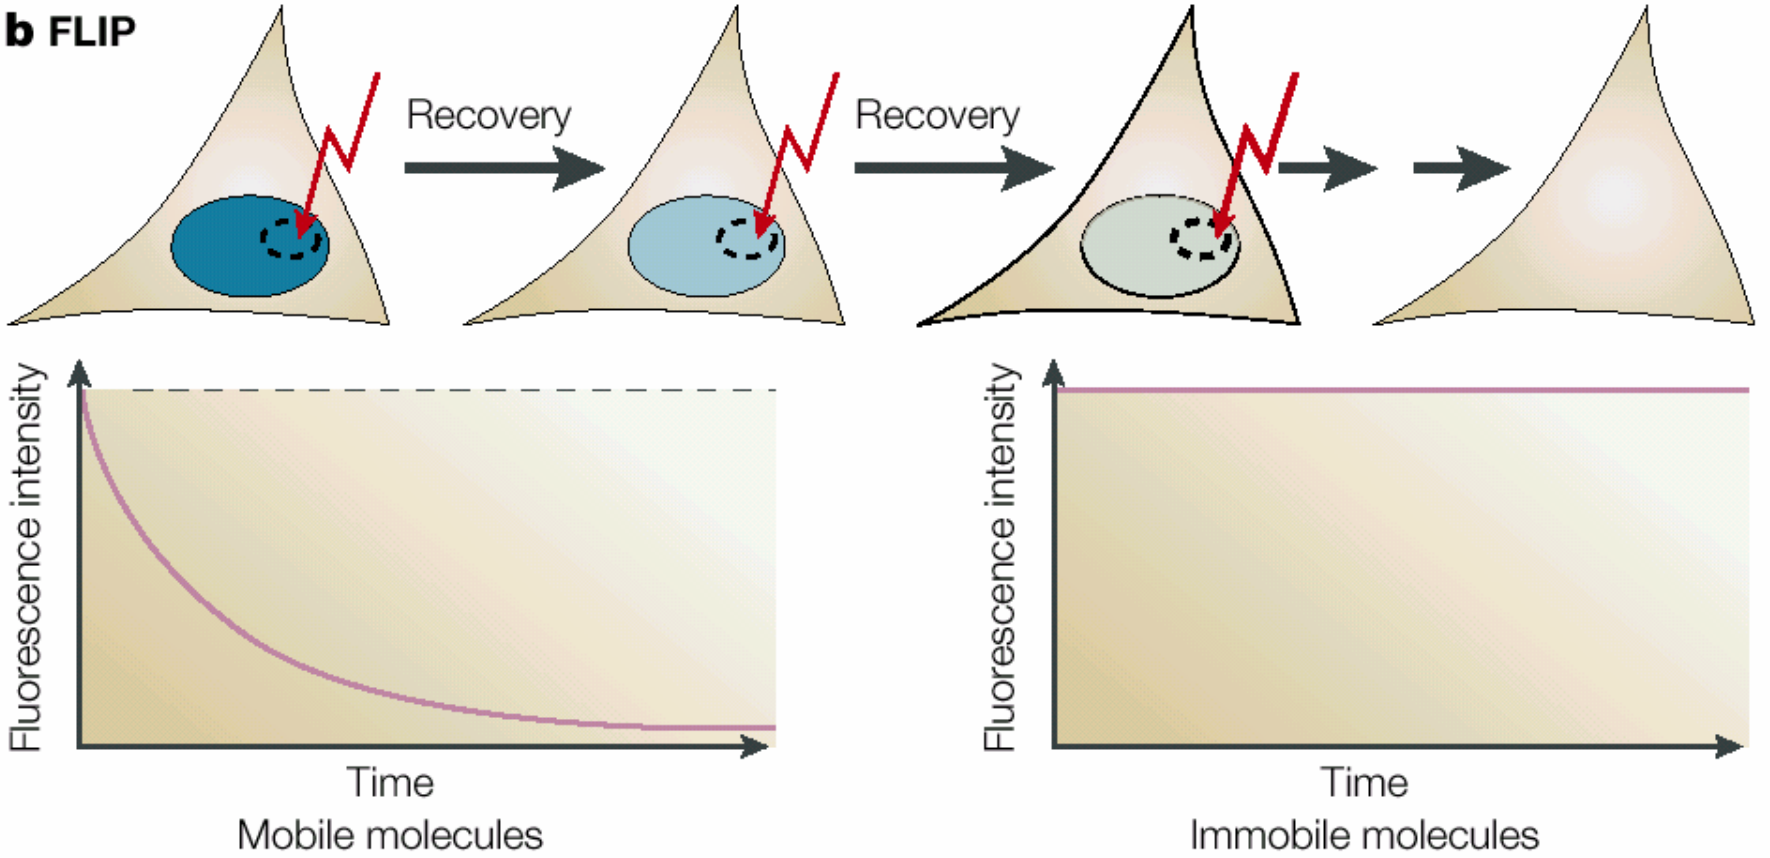
Lippincott-Schwartz et al. Nature CellBio Supp. 2003

Problem:	**Potential explanation**
Partial recovery:	**e.g. immobile fraction, physical separation**
Reversible photobleaching:	**fixed samples, varition of the bleach spot size**
Non-diffusive behaviour:	**binding, active transport => modelling**
Different values in consecutive measurements:	**photodamage**

Overview

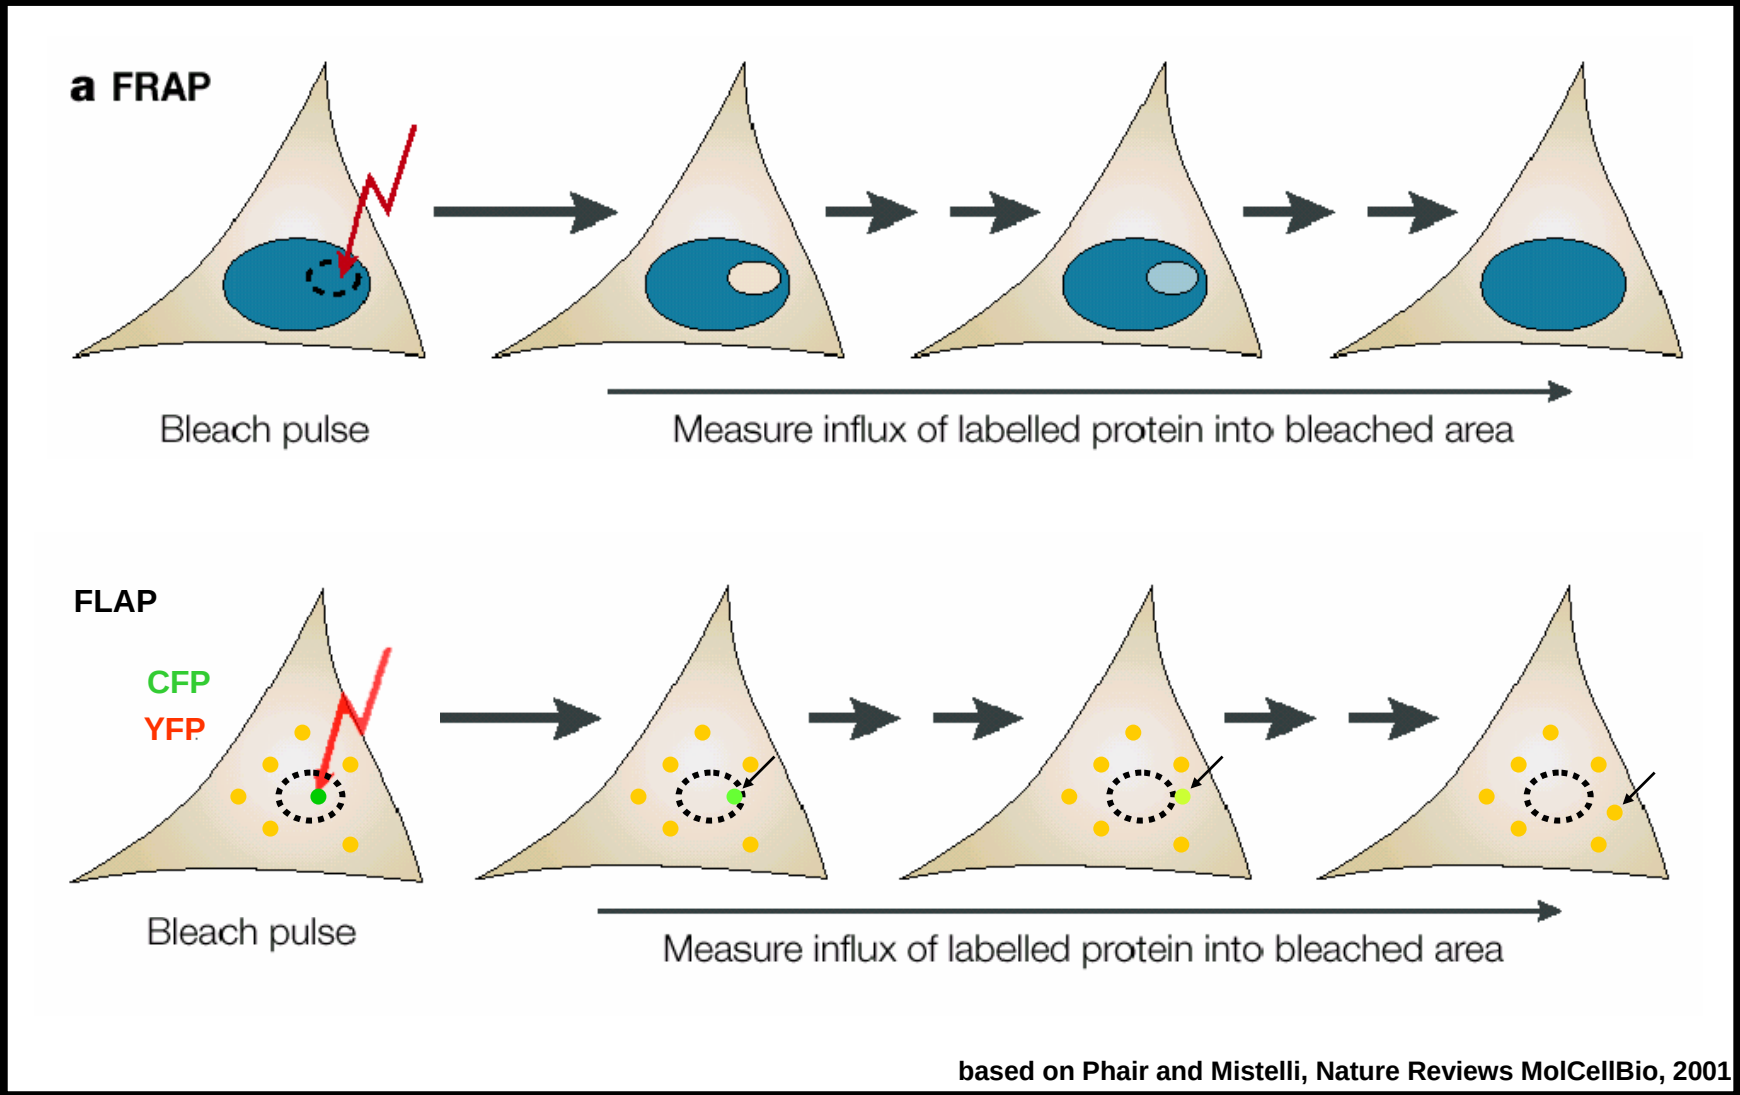
1) Introduction
2) FRAP principles
3) FRAP data analysis
4) Related techniques (FLIP, FLAP, Photoactivation, -conversion
5) Possible limitations
6) New technology developments

Fluorescence Loss in Photobleaching (FLIP)



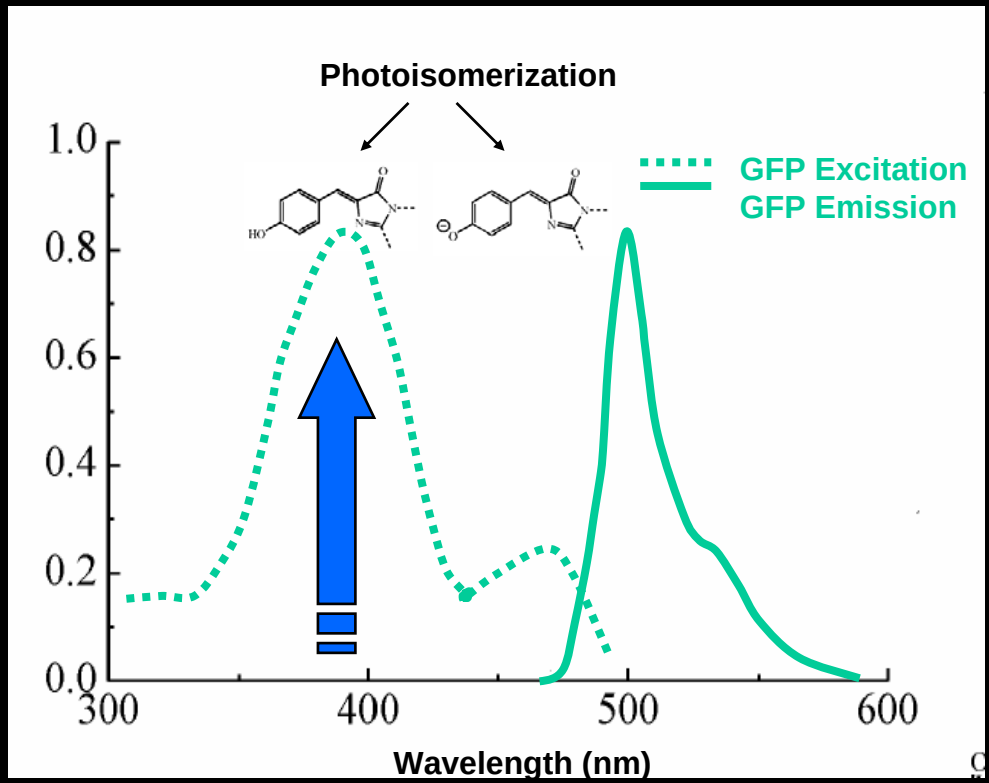
Phair and Mistelli, Nature Reviews MolCellBio, 2001

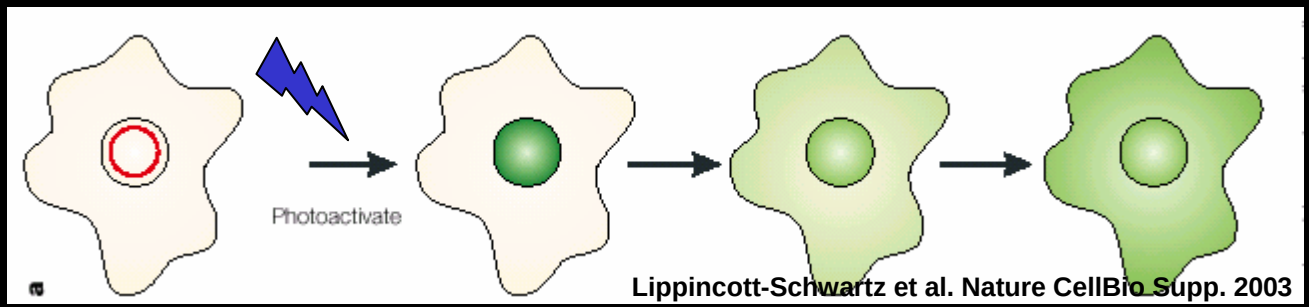
Fluorescence Loacalisation After Photobleaching (FLAP)



based on Phair and Mistelli, Nature Reviews MolCellBio, 2001

Photoactivatable GFP



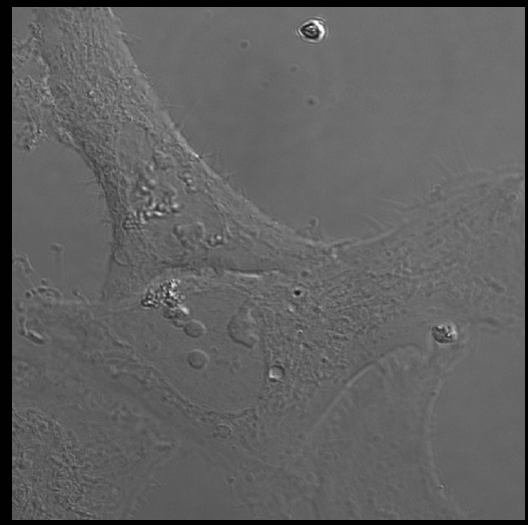


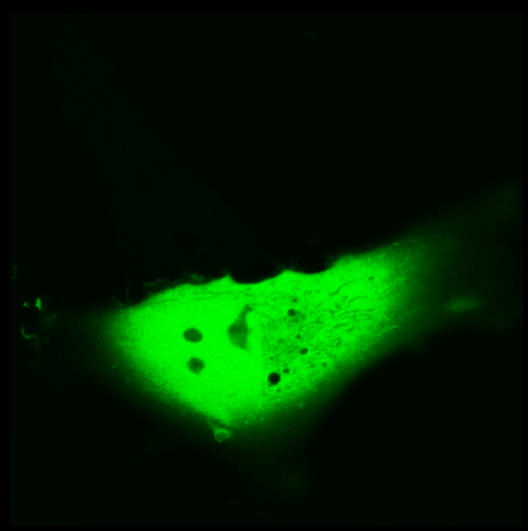
Lippincott-Schwartz et al. Nature CellBio Supp. 2003

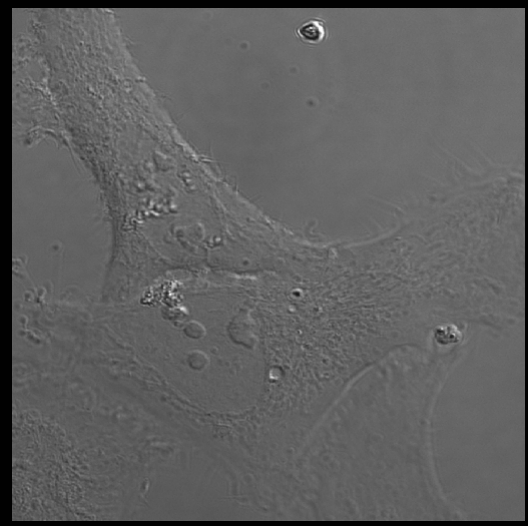
Photoactivatable GFP (PA-GFP)

Excitation at 488 nm

Irradiation at 405 nm

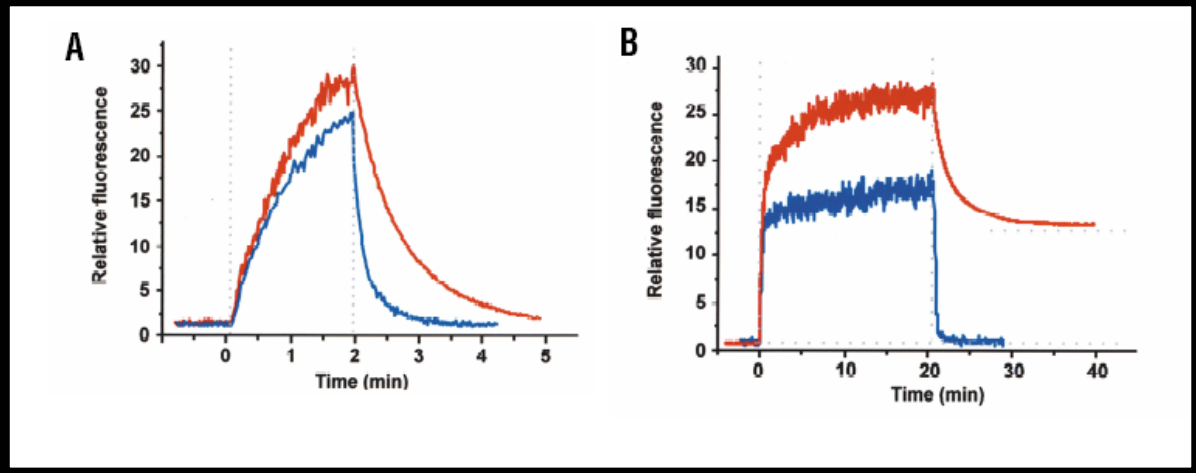


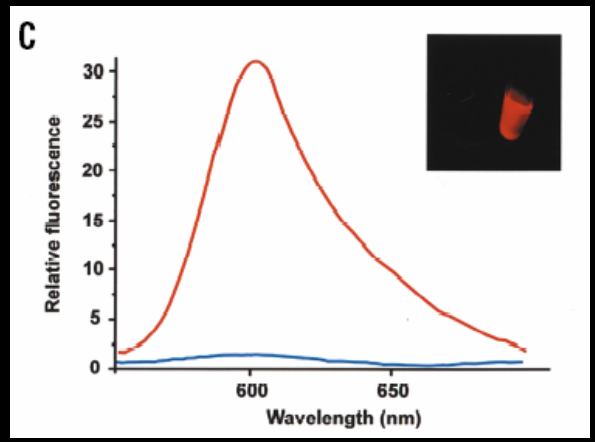




Patterson and Lippincott-Schwartz (2002), Science 297:1873-1877

Kindling (KFP)





488 nm

O_2

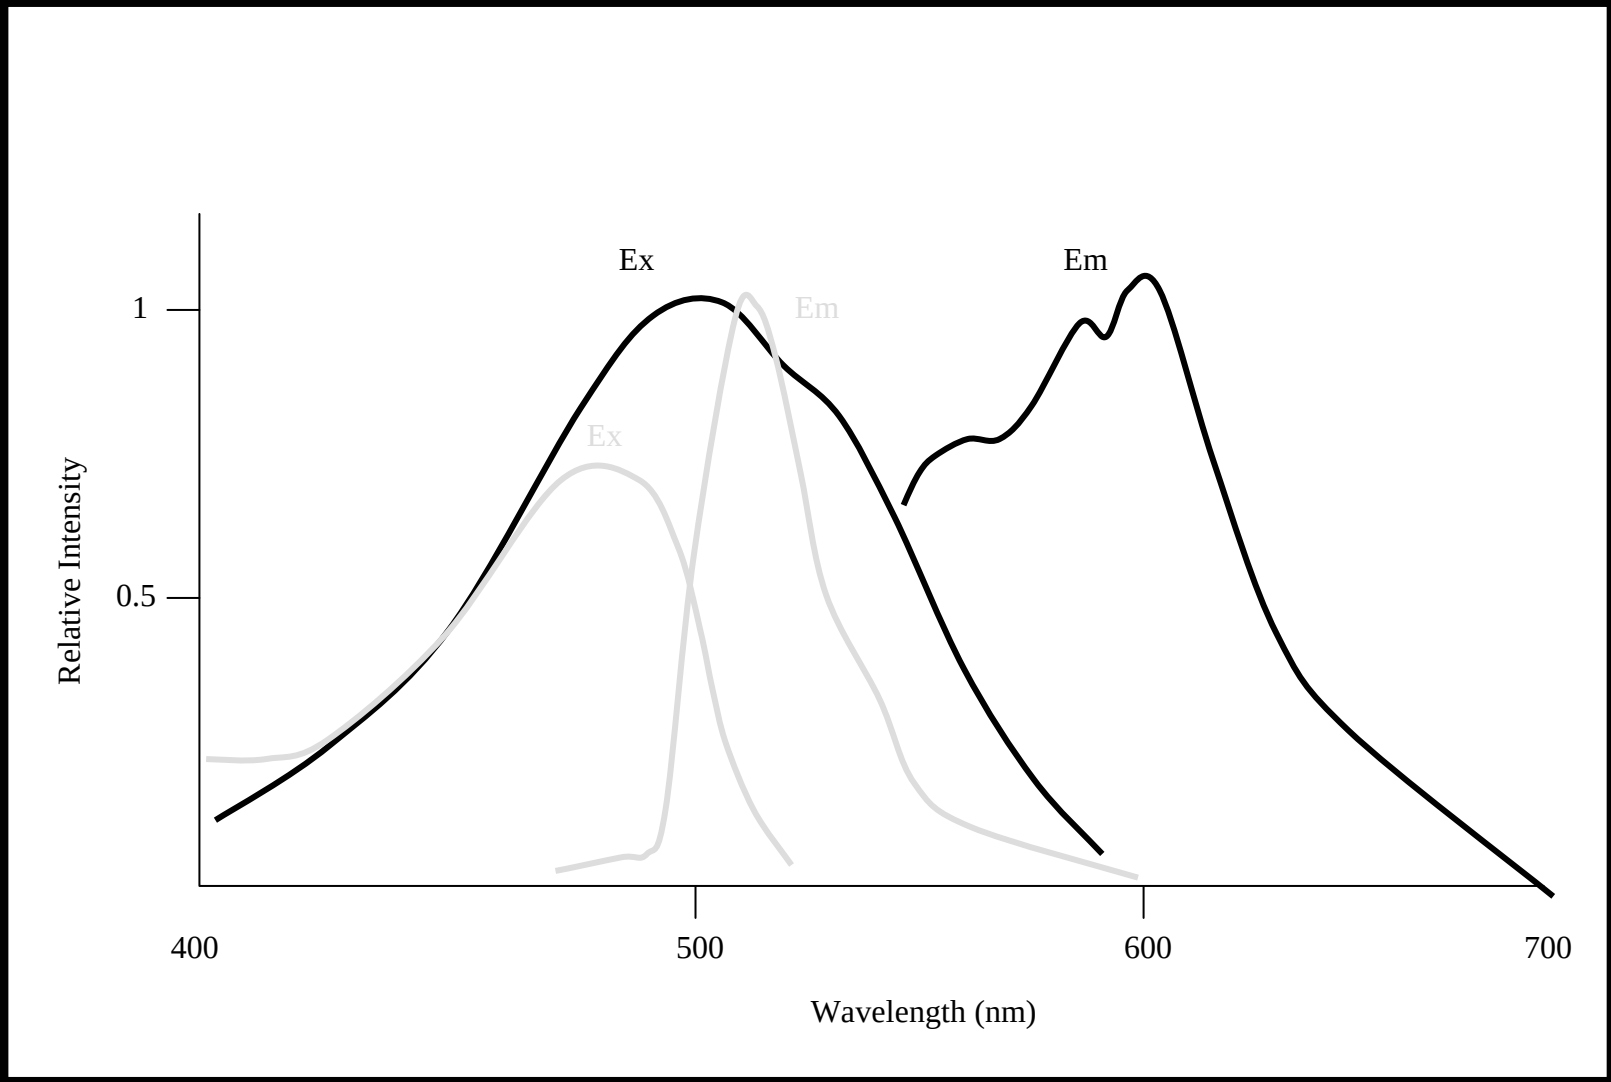
488 nm

O_2

543 nm

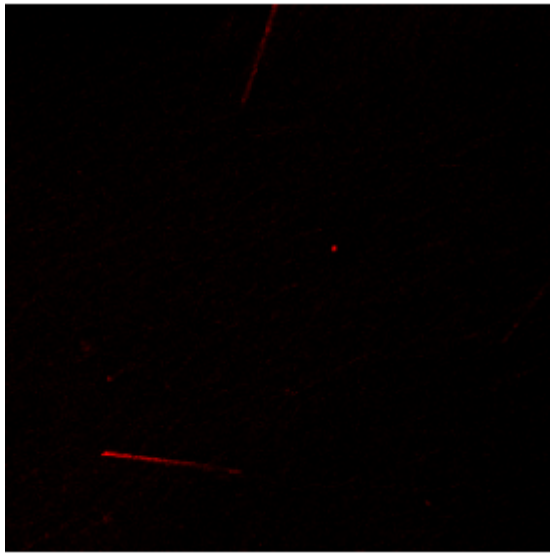
O_2

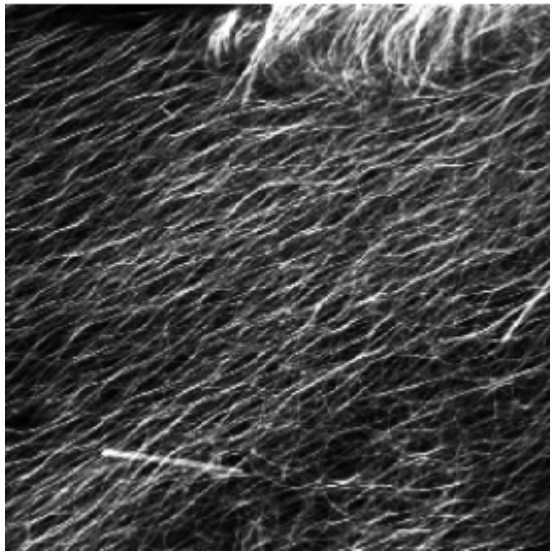
Spectral change after photoconversion

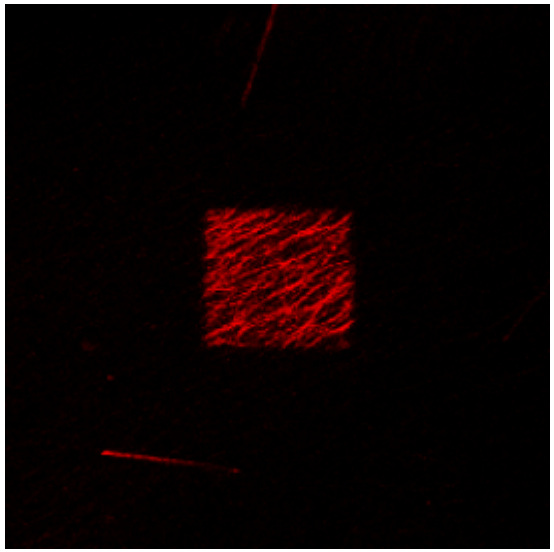


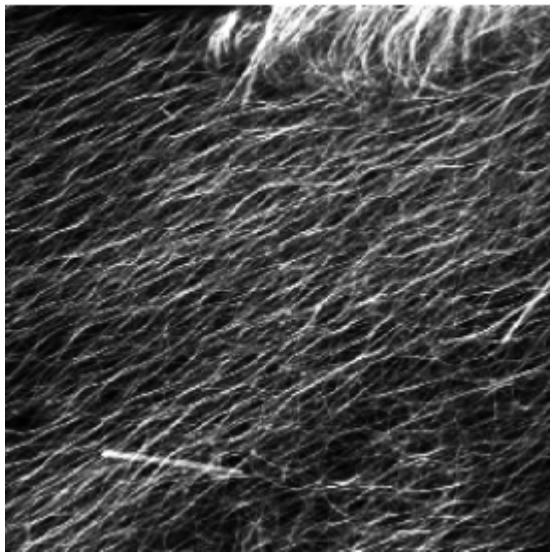
after Elowitz et al. (1997), Curr. Biol. 7:809-812

Microtubule binding proteins (TPX2)









Photoconverted
GFP

Cy5-labelled
microtubules

Kaede

Acquiring images of Kaede-expressed HeLa cells while exciting with a 488nm/543nm laser every 3 seconds, and observing the reddening processes via 405nm laser illumination with SIMS scanners.

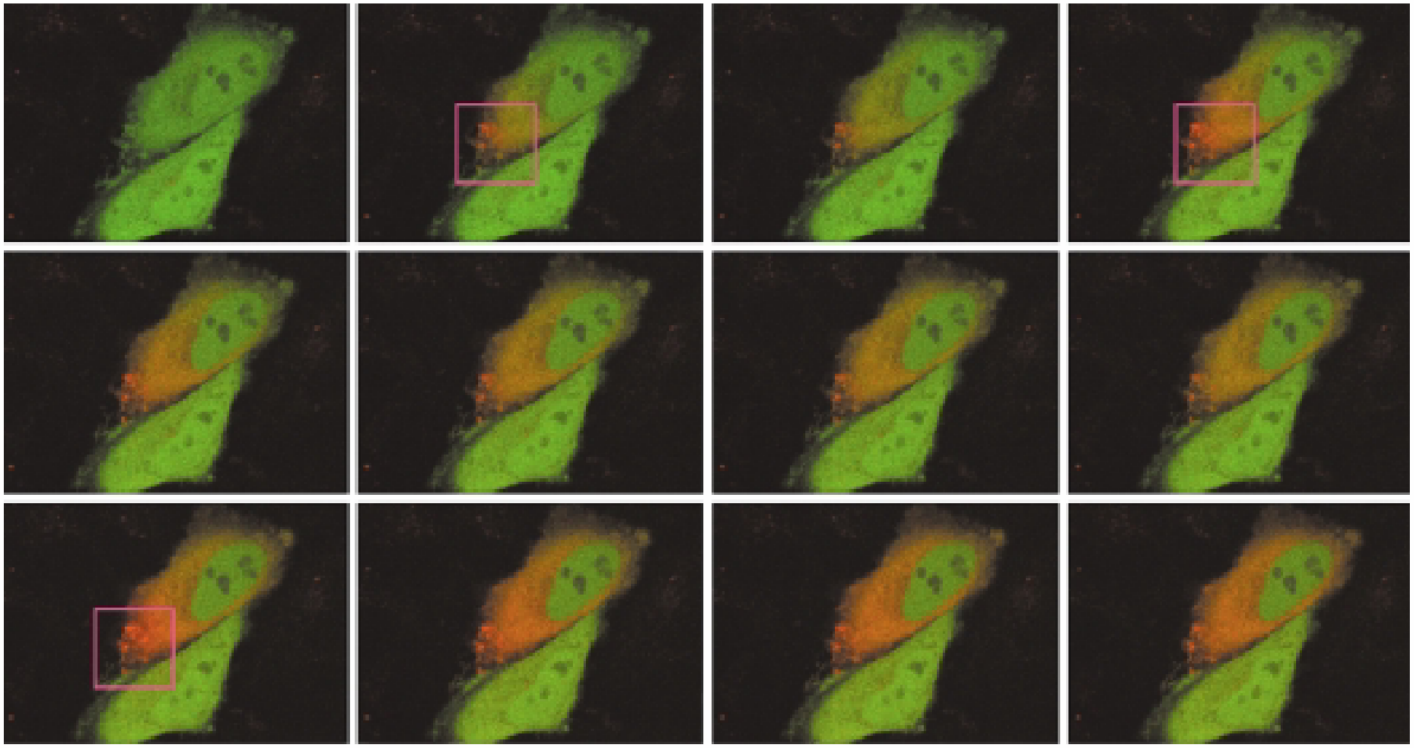
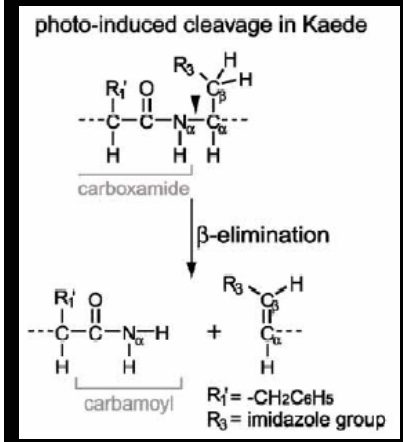
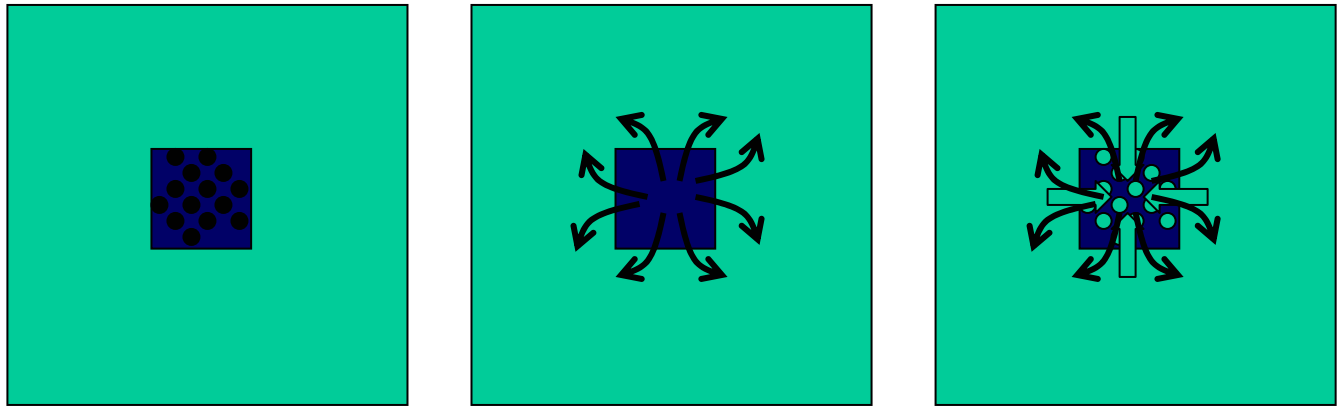
Objective: UPlanApo60xoil





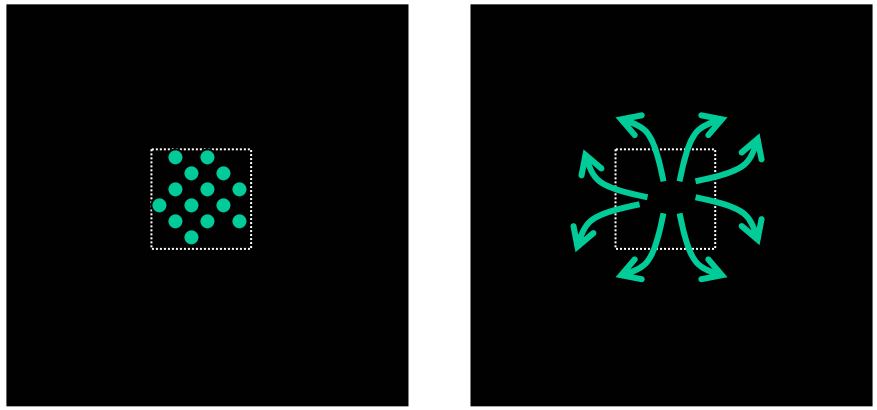
Advantages of photoactivation

FRAP



Off + On
Background of unbound molecules

iFRAP, Photoactivation, Photoconversion



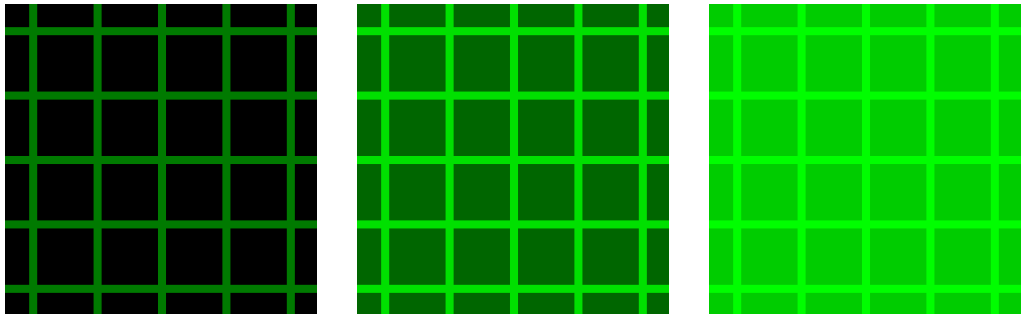
Off

⇒Direct measurement of the Off-Rate
Negligible background

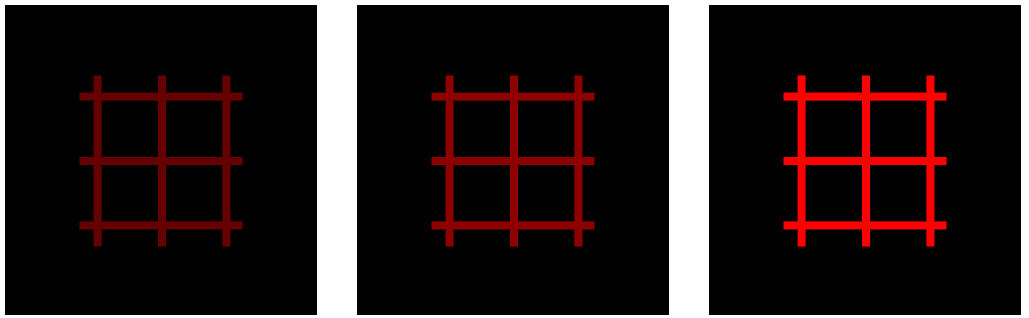
Advantages of photoconversion

Binding measurements

GFP channel



Photoconverted GFP channel



[C]

⇒No background correction
High signal to background

Overview

1) Introduction
2) FRAP principles
3) FRAP data analysis
4) Related techniques (FLIP, FLAP, Photoactivation, -conversion
5) Possible limitations
6) New technology developments

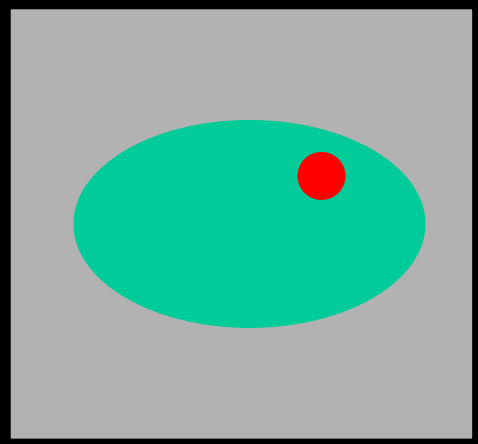
Present limitations of quantitative FRAP analysis

- The experimental system does not correspond to a 2D diffusion model => 3D FRAP models have been developed
- Diffusion during the bleach period is neglected, leading to underestimation of diffusion coefficients => calculation models, technical solutions

Intensity of bleaching light

AOTF upregulation (0-100%):

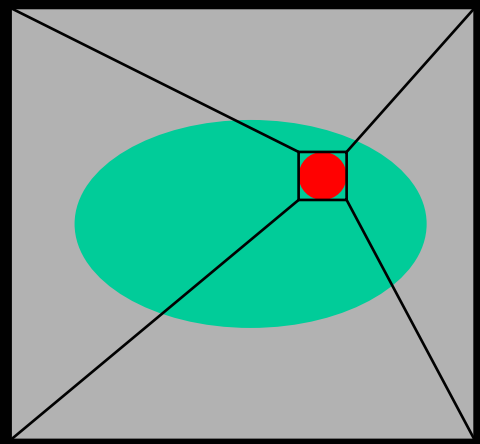
Linear



Zoom In:

Exponential

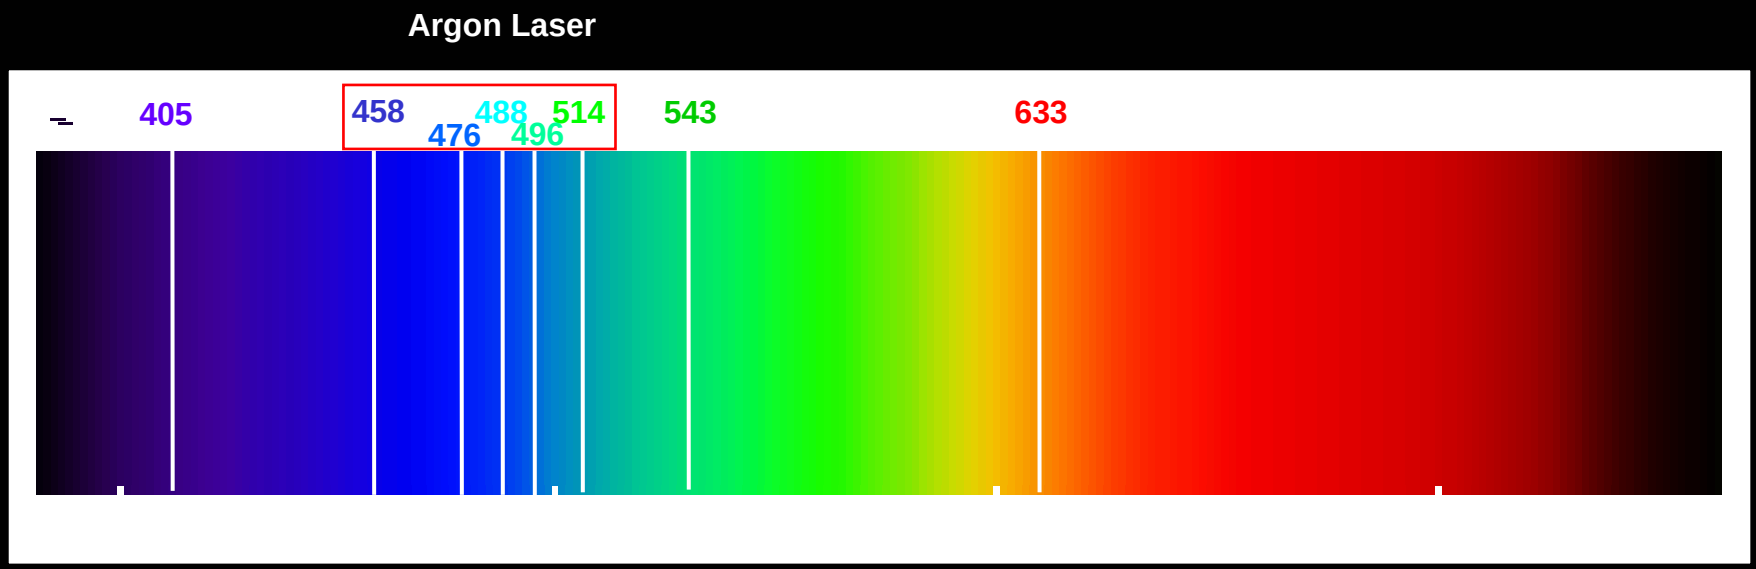
$2^{zoomfactor}$



Speed limited, does not work with ‘Fly’-Mode

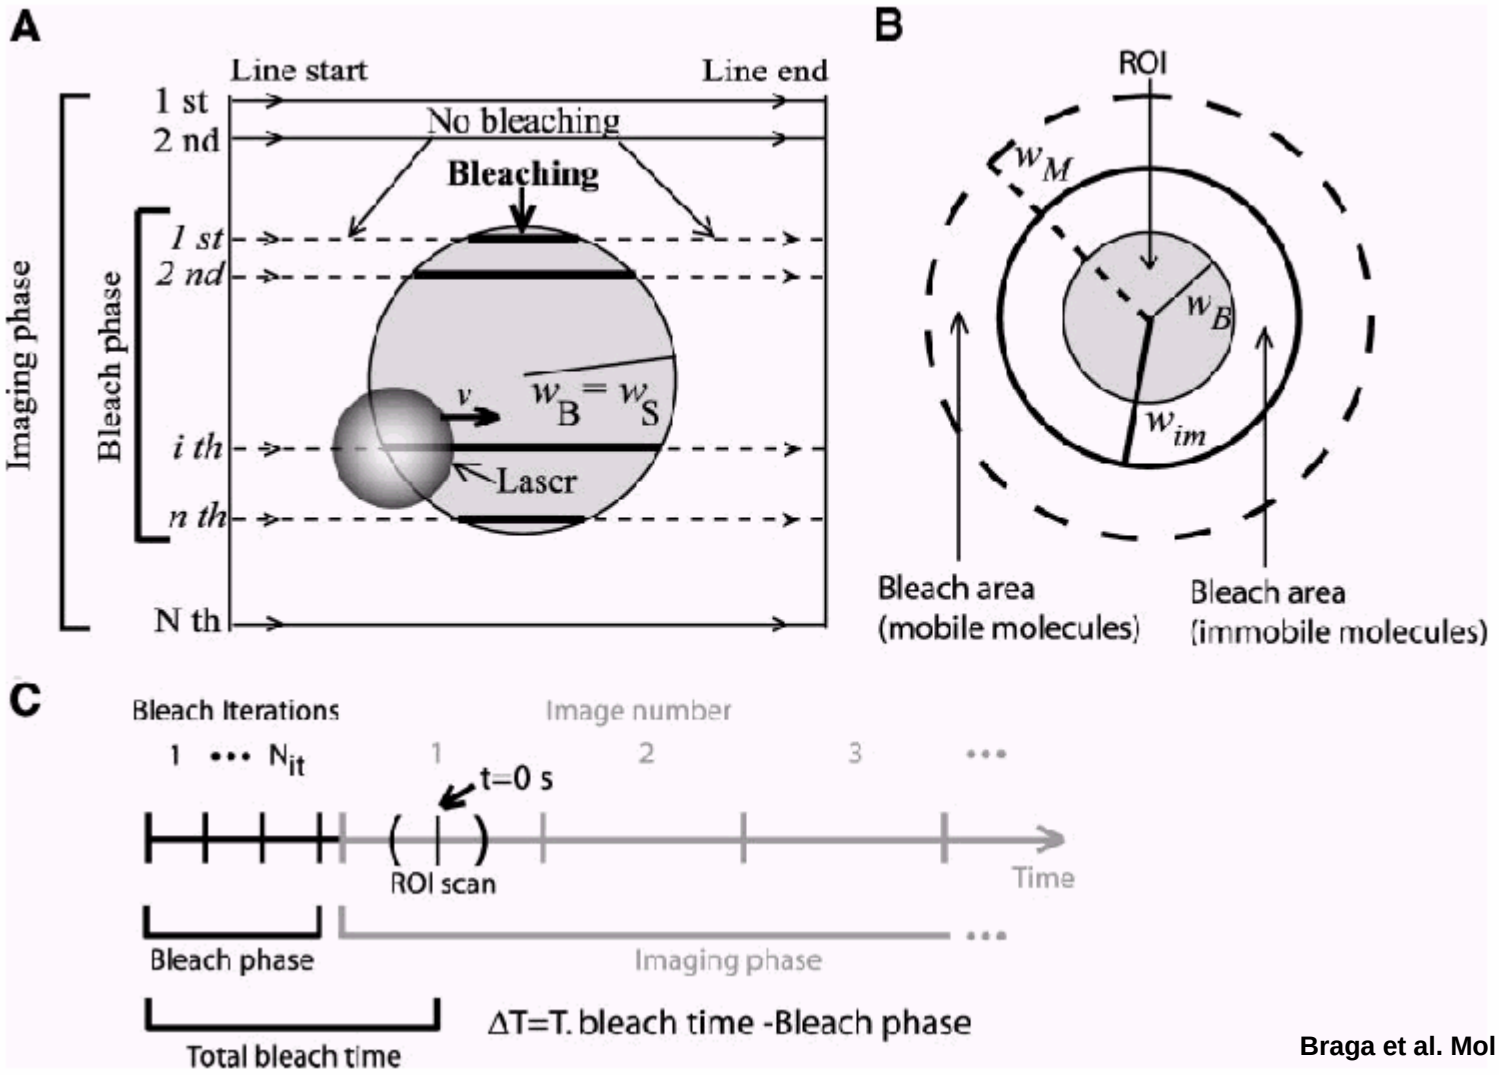
Leica AOBS SP2

Available laser lines



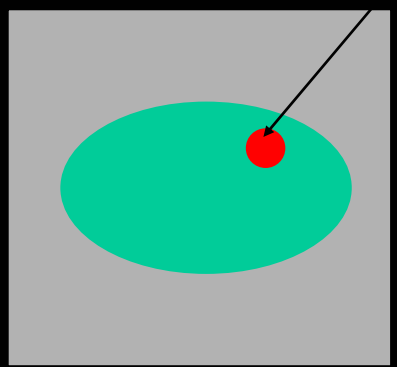
Argon laser

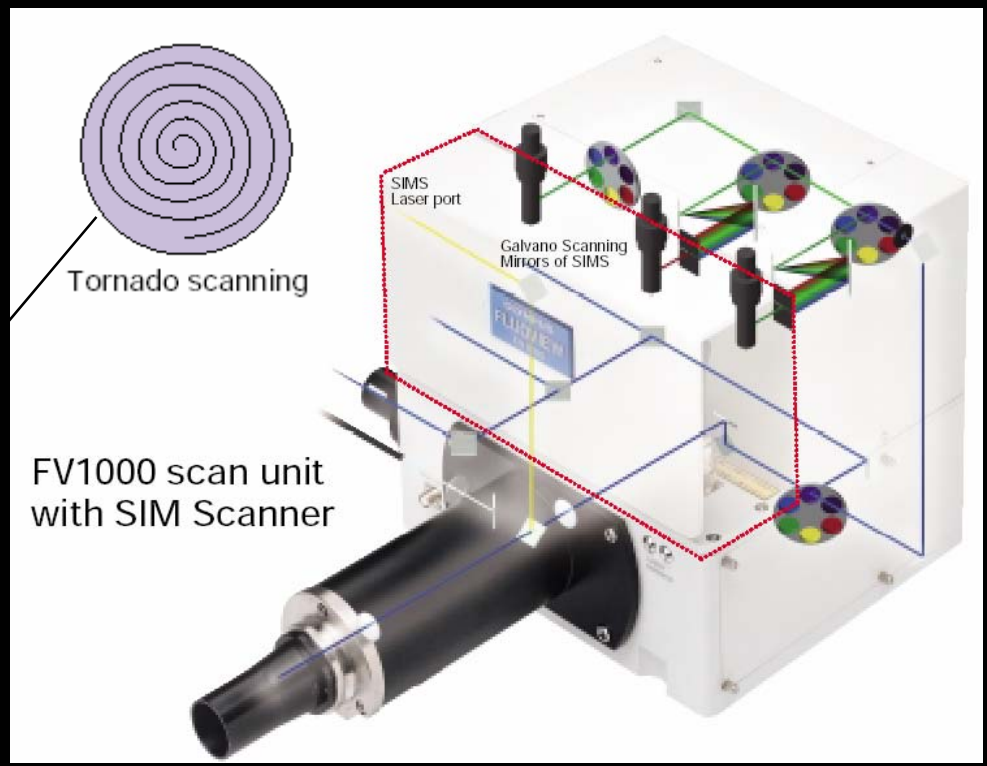
100 mW => 500 mw



Braga et al. Mol Biol Cell, 2004

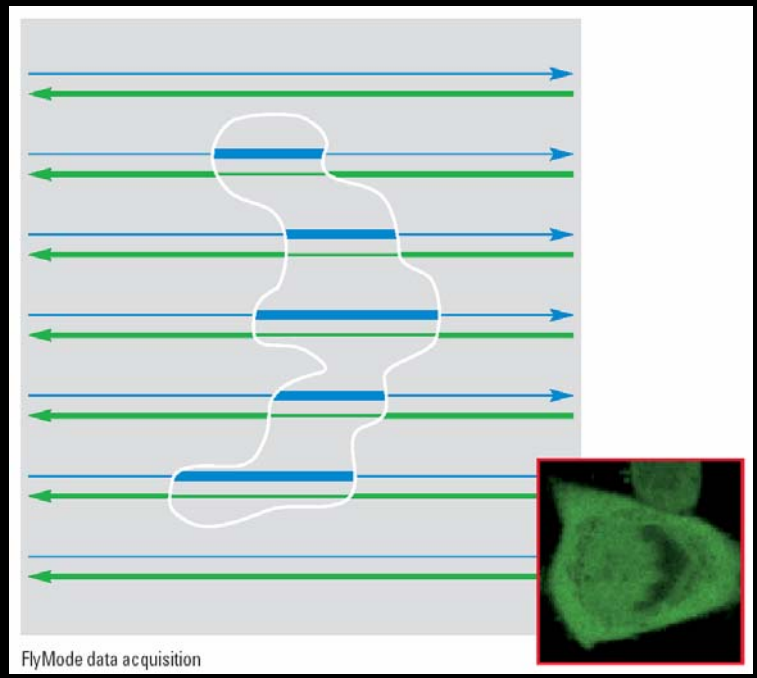
Olympus FluoView 1000





Leica AOBS SP2

‘Fly-back’ FRAP detection



=> readout within milliseconds of bleaching

Renaissance of widefield microscopes with sensitive CCD cameras and laser bleaching modules (Deltavision RT Quantifiable Laser module)
