PRODUCT BULLETIN

SI-BSC-6A Shield Bonding Connector

MacLean Senior Industries (MSI) is pleased to introduce the latest addition to our Bonding and Grounding product offering. Shield Bonding Connectors are designed to make stable, low resistance electrical connections between the shield of a communication cable and a conductor.

Features - The MSI Shield Bonding Connector provides the following improvements over similar industry products:

- The teeth in the upper jaw penetrate the entire length of the connector when it is assembled and tightened. The upper jaw does not cam up and away from the communication cable when tightened down.
- A slim design allows for easy installation and requires minimal preparation of the communication cable. The MSI design easily inserts underneath the shield and firmly locks into place.
- The serrated nut acts as a lock-nut and is a standard option for all MSI shield bonding connectors. This ensures that the jaws and components remain secure after tightening.

The Shield Bonding Connector consists of the following parts:

- Upper jaw with teeth
- Primary serrated "locking" nut
- Lower jaw with teeth
- Secondary "locking" nut
- Plastic guide (assists with insertion of the connector and protection of the cable conductors)
