Figure B- 1

RF DEPOT offers many MIL-C-17 qualified coaxial and SEMIRIGID cables from stock. The MIL-C-17 insures consistent comprehensive standards for each applicable cable type. These cables are commonly referred to as QPL cable. RF Depot recommends and uses only QPL qualified products, where one exists, in all cable assemblies. This quality measure has little or no impact on cable assembly pricing due to our purchasing power. RF DEPOT also stocks many high performance, application specific, specialized coaxial cable types yet to be listed in MIL-C-17.

All RF DEPOT cable assemblies are carefully assembled and DC tested in a laboratory environment. RF testing to 40.0 GHz on a Pass/Fail basis is available as an option with little or no impact on delivery. Certification testing is available to 40 GHz, which includes the original evaluation data report. RF DEPOT will retain a complete copy of the evaluation data.

Standard assemblies are offered in custom lengths with quick delivery at favorable prices. Typical small quantities of flexible cables and most SEMIRIGID cables are shipped within one week of receipt of order. Prototypes of SEMIRIGID cables formed to meet custom requirements are shipped within 10 days of receipt of order.

RF DEPOT coaxial cable assemblies are made to exacting tolerances, with a typical flexible cable assembly tolerance of $\pm 0.375''$ or 1.5%, whichever is greater. SEMIRIGID tolerances are $\pm 0.025''$ or 1%, whichever is greater. Within any one manufacturing lot, all SEMIRIGID cable assemblies maintain a tolerance of ± 0.015 inch. If electrical length is critical, electrical length should be specified. RF DEPOT recommends that a phase reference standard cable be maintained if duplicate items are likely to be needed.

Custom marking of cable assemblies can

be provided in accordance with any specific customer supplied documentation. Refer to "How to Order Cable Assemblies" for help in choosing assembly options.

FLEXIBLE CABLE ASSEMBLIES

RF DEPOT flexible cable assemblies are cut and precision trimmed using computer controlled rotating cutters specifically designed for that purpose, insuring the highest degree of accuracy.

Strain relief boots as well as heat shrinkable tubing are offered on most cable assemblies. Optional heavy wall shrink tubing with adhesive inner wall can be supplied to provide superior strain relief, and are applied in a manner for the inner adhesive wall to adhere to both the connector backshell and the cable jacket. The use of such reliefs is recommended whenever a cable may be subjected to rough handling such as field use. These reliefs however are effective only where the cable jacket OD and the connector backshell OD have a ratio of approximately 1.8:1 or less.

Coaxial cables can be supplied with other than coaxial connectors such as alligator clips or "banana jacks". When two banana jacks are specified, the center conductor and dielectric are withdrawn through a small opening in the shield. The shield is left intact and is insulated with shrinkable sleeving. The "V" joint is treated with heavy wall shrink tubing and a cosmetic "V" joint is formed similar in appearance to a molded junction.

SEMIRIGID CABLE ASSEMBLIES

SEMIRIGID cable assemblies are prepared using both MIL-C-17 and application specific SEMIRIGID stock. Each SEMIRIGID blank is precision cut using an RF DEPOT model 94 cable saw ensuring the

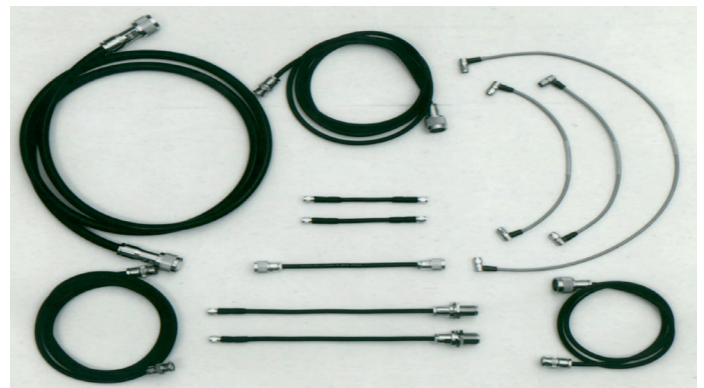

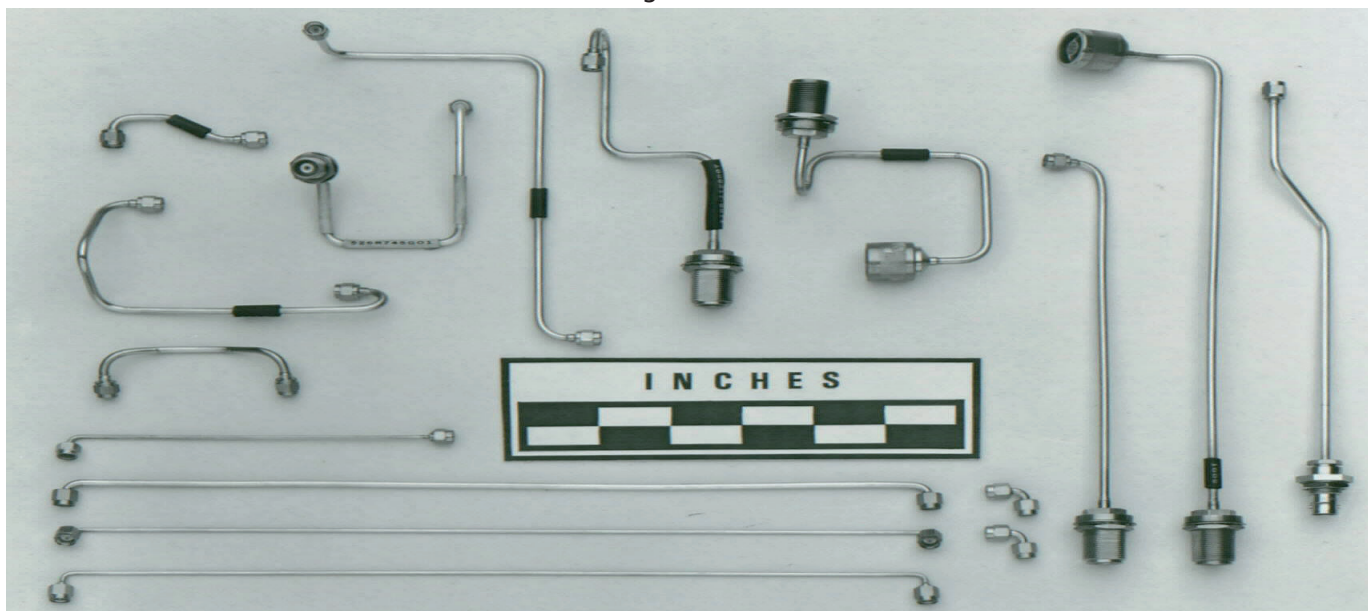

Figure B- 2

tightest of tolerances and complete repeatability.

Depending upon the physical characteristics of the blank, trimming is accomplished either by incremental milling or scribing tech-

Figure B- 3

nique. Assemblies using the center conductor as the connector interface pin are pointed at this time.

When a separate connector contact is not used, RF DEPOT recommends a steel (copper flash with silver plate) center conductor. Unless otherwise specified, RF DEPOT SEMIRIGID cable assemblies will be supplied with steel center conductors.

To minimize delivery time and provide maximum cost effectiveness, RF DEPOT will lay out cables within a customer furnished assembly, provide forming data suitable for subsequent manufacturing. A copy of MIL-D-1000 forming drawing suitable for preparation of traditional assembly and inspection drawings is provided in initial order.

FORMED SEMIRIGID ASSEMBLIES

RF DEPOT offers formed SEMIRIGID assemblies to customer specification. When ordering formed SEMIRIGID Cable assemblies, the following guidelines should be observed to maximum cost effectiveness:

- a) Use a constant bend radius wherever possible.
- b) Specify radii from centerline of cable. Standard RF DEPOT tooling for both 0.085" and 0.141" diameter cable provides for bend radii of: 0.625", 0.50", 0.375", 0.312", 0.250" and 0.220". For 0.085" cable only, Standard RF DEPOT tooling also provides for centerline radii of 0.150", 0.125" and 0.10". Slightly smaller radii can be provided for 0.141" cable where absolutely necessary.

c) Use a straight section at the connector interface of at least 1.0" on 0.141" diameter cable and 0.50" for 0.085" cable wherever possible.

d) For angle bends, specify both rectangular coordinates in true size projection.

e) If scale drawings are made, use full scale and not half or twice size. Provide measurable dimensions such as outside of cable to connector end with theoretical dimensions as reference only.

f) Provide all usable tolerances on dimensions, even if such results are +0.5" minus 0.0" or similar. Cost effective tolerances for bend locations are \pm two cable diameters with \pm one-half cable diameter typically provided.

g) If providing customer drawings, locate and dimension all tangent points, connector reference planes and trimmed cable ends.

CUSTOM RIGHT ANGLE ASSEMBLIES

RF DEPOT Custom Right Angle SMA assemblies were designed to fulfill the requirements satisfied by SMA right angle connector assemblies, without degradation to SWR and insertion loss characteristics. This is achieved using custom made tooling and a low profile SMA connector. The RF DEPOT custom Right Angle Assembly is shown in figure B-4.

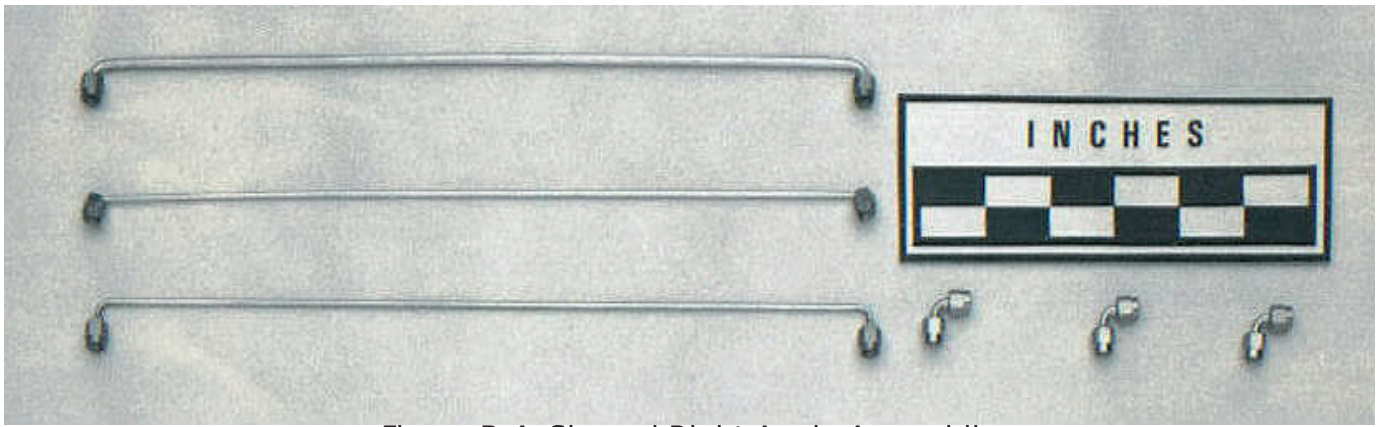

Figure B-4: Shaped Right Angle Assemblies

CLOCKING

All orders for assemblies having two right angle connectors, or one right angle connector and one keyed connector should be accompanied by clocking instructions. A written comment in the purchase order description is sufficient. Clocking, specified in degrees, refers to the angular difference between the two center pin reference planes for assemblies having two right angle connectors, and the angular difference between the right angle connector center pin and the key for keyed connector.

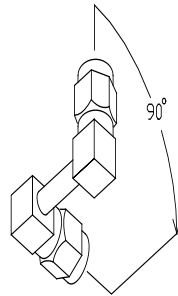

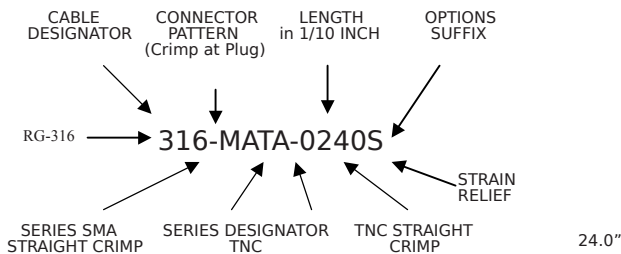

Figure B-5: Clocking Diagram

HOW TO ORDER CABLE ASSEMBLIES

The individual components of each RF DEPOT part number define the composition of the cable assembly. Designators for the components are contained in Table B-2 on page B-4. The RF DEPOT part number defines the below example as follows:

Designators identifying product options such as custom markers, strain relief, testing and serial numbering are also contained in Table B-2, and should be utilized where possible as a suffix to the part number. RF DEPOT assigns a unique accession number in place of the specified length for all pre-formed SEMIRIGID assemblies.

CABLE MARKERS

When ordering cables with markers, specify characters in legible format and designate which end or center position for each marker. For logistical support applications, contact RF DEPOT for a specific accession number that will designate all cable markers. For all other orders specify markers on face of purchase order. Use Table B-1 as an example when specifying marker information. When possible, provide drawings indicating marker positioning, and specific placement on the cable assembly. Where marker positioning is not critical, general statements included with marker information such as "markers will be within 3.0" from connector body are sufficient.

ASSEMBLY	MARKER A	MARKER B	MARKER C
316-MA-MA-0120FF	R1A12J1RF OUT	ASSY R1A2	R1A12J2RF IN
316-MA-MA-0240FF	R1A2P1IF IN	ASSY R1A2	R1A12P1IF OUT

Table B-1: Cable Marker Documentation

RF DEPOT standard method of marking is permanent ink or heat-stamped black characters on shrinkable white tubing.

RF DEPOT offers color coding in ten EIA colors at no additional cost. Just add the appropriate suffix from the color table. Color coding is by pre-molded strain relief boots or by shrinkable tubing depending on the diameter of the coaxial connector. Black shrinkable tubing with an adhesive inner wall provides excellent strain relief. The use of a strain relief is recommended whenever an assembly is subjected to rough handling such as field use. These reliefs are effective only where the cable jacket O.D. and the connector body O.D. have a ratio of approximately 1.8:1 or less. Strain relief for small diameter cable assemblies having ratios of greater than 1.5:1, can be accomplished by first installing heavy wall shrink tubing on the cable, flush with the connector body, and an overall strain relief covering the first layer of tubing and the connector body.

SPECIAL ORDERS

RF DEPOT can produce cable assemblies using customer supplied materials in accordance with most drawings and documentation. When placing special orders, provide all documentation with

purchase orders, including but not limited to drawings, connector assembly instructions and marking requirements. RF DEPOT assumes no responsibility for assemblies produced based on incorrect customer supplied information. Make every effort to provide accurate and complete documentation.

ASSEMBLY TYPE	SETUP	DELIVERY IMPACT	RL & IL & PHASE	RL & IL Per Unit	2 x RL & IL
Most Coax to 6 GHz	\$0.00	None	\$3.00	\$3.00	\$4.00
Type SMA to 20 GHz	\$0.00	None	\$6.00	\$6.00	\$7.50
Type Nto 18 GHz	\$0.00	None	\$6.00	\$6.00	\$7.50
Type 2.9/K/ SMA to 26 GHz	\$50.00	None	\$20.00	\$15.00	\$20.00
Type 2.9/K to 33 GHz	\$50.00	1 Day	\$24.00	\$15.00	\$24.00
Type 2.4 to 40 GHz	\$62.50	1 Day	\$34.00	\$24.00	\$34.00

Table B-4: Cable Assembly Testing

TESTING AND CERTIFICATION

RF DEPOT offers SWR, return loss, insertion loss and phase testing to 40 GHz. Temperature and humidity testing is also available to 40 GHz. Assemblies are identified with temporary paper tags, unless directed otherwise. Permanent item marking is separately priced. The schedule of testing availability and delivery impact is provided in Table B-4.

Testing is for return loss (SWR) at one end and insertion loss, all plotted on one graph. Two-way return loss (SWR) is applicable only for same series connector on each end and plotted on the same paper. For non-insertable assemblies (Jack to Jack or Plug to Plug), a high quality gender changer is included in the calibration and subsequent testing. Other testing, including phase and SWR is available at individual piece prices. SEMIRIGID is phase stabilized, when requested or specified, after bending with two temperature cycles from -50°C to +150°C. The RF DEPOT test chamber limits the size of the particular assemblies under test. Contact RF DEPOT when considering phase stabilizing or temperature testing.

RF DEPOT maintains a large inventory of coaxial connectors and invites inquiries for assemblies using other than the “standard” designated connectors. The standard connectors however have been selected for best utility and reliability together with most reasonable cost effectiveness and should be deviated from only under special circumstances.

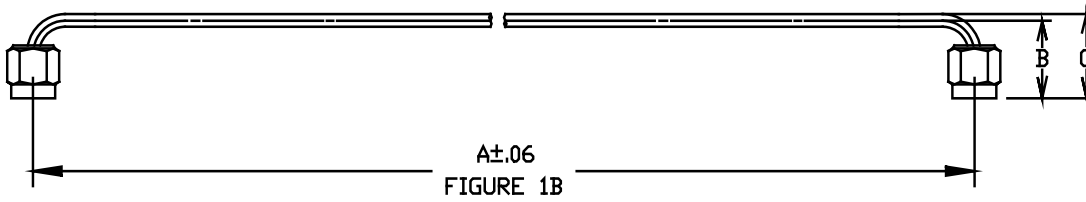

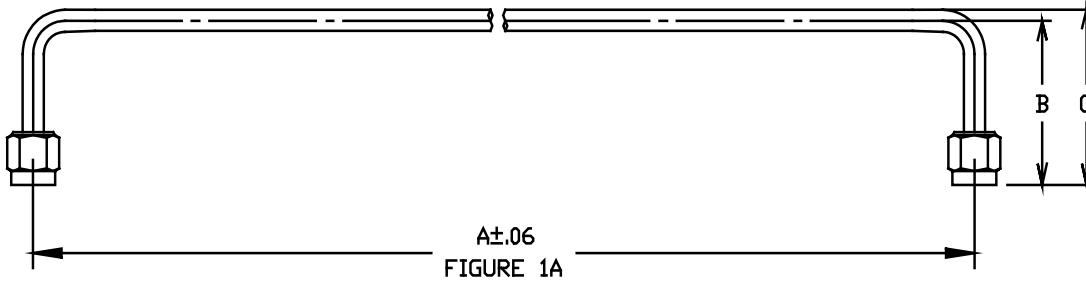

There are many reasons for choosing a particular coaxial connector for a specific application. RF DEPOT invites discussions and inquiries on specific applications and considerations. For instance, a properly terminated SMA connector without center contact on 0.141-diameter SEMIRIGID cable offers lower insertion loss than does a connector with a separate contact even though the separate contact is usually gold plated.

STANDARD SEMIRIGID ASSEMBLIES

STANDARD SEMIRIGID ASSEMBLIES

RF Depot offers right angle SEMI-RIGID cable assemblies from stock to eliminate the need for special right angle connectors. These cable assemblies use special bending techniques to achieve the same excellent performance of swept right angle or straight connectors at a reasonable cost.

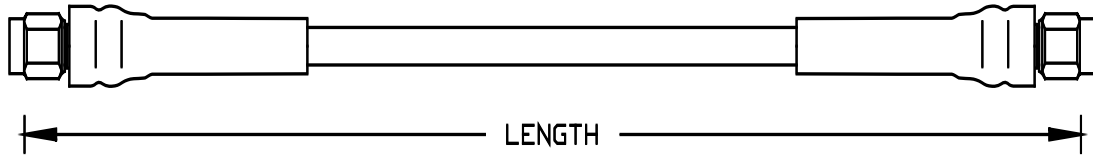

These RF Depot assemblies have a short right angle at each end of a cable of nominal 12 to 18" length. The intended application is for the customer to cut this assembly in two parts and to finish the assembly as required. The factory bent right angle offers Significantly better performance than a mitered right angle connector and a lower cost than the equivalent swept or high performance connector.

This unique RF Depot construction offers opportunity for the cable to be tested before the secondary operation of customizing. Right angle "pigtaills" supplied by others are difficult to examine electrically at incoming inspection and the vendor usually disclaims all responsibility for electrical performance of the resulting assembly. RF Depot now offers a longer more versatile assembly at a lower cost than the previous assembly.

Custom Assemblies and other lengths are available with reasonable prices and delivery.

Other custom services include design, documentation, marking and testing of all types of coaxial cable assemblies.

EXTENDED DISTANCE QUIET CABLE PIN CONNECTIONS (EDQ)

Specifications:

Cable Construction: Twisted pairs covered with shorted foil shield to attenuate high frequency emissions and copper braid shield to attenuate low frequency emissions.

Number of Conductors: 4, 7, 12, 16, or 25

Conductor Gauge: 24 AWG, stranded copper

Connectors: DB25 (Gender is Customer Supplied)

Hoods: Molded on factory assembled cables; die cast metallic on field installed cables.

Capacitance: 12pf +/- 2 pf/ft

Impedance: 125 ohms per foot

<p>4 CONDUCTOR CABLE EM04C and EB04C</p> <ul style="list-style-type: none"> 2---Black 7---White 3---Red 20---Green <p>12 CONDUCTOR CABLE EM12C and EB12C</p> <ul style="list-style-type: none"> 1---Black 17---White 3---Red 6---Green 2---Brown 7---Blue 4---Orange 5---Yellow 8---Violet 15---Grey 22---Tan 20---Pink 	<p>7 CONDUCTOR CABLE EM07C and EB07C</p> <ul style="list-style-type: none"> 2---Black 8---White 4---Red 6---Green 3---Brown 7---Blue 20---Green/Yellow <p>16 CONDUCTOR CABLE EM07C and EB07C</p> <ul style="list-style-type: none"> 1---Black 17---White 3---Red 6---Green 2---Brown 7---Blue 4---Orange 5---Yellow 8---Violet 15---Grey 21---Tan 20---Pink 22---White/Blue 25---Brown/White 	<p>25 CONDUCTOR CABLE EM25C and EB25C</p> <ul style="list-style-type: none"> 19---Black 17---White 18---Red 16---Green 12---Brown 11---Blue 21---Orange 20---Yellow 13---Violet 14---Grey 25---Tan 24---Pink 9---White/Blue 10---Blue/White 5---White/Brown 6---Brown/White 2---White/Orange 4---Orange/White 1---White/Green 23---Green/White 2---White/Red 4---Red/White 1---White/Black 23---Black/White 22---Green/Yellow

37	J-EQ37A	10 - 14	Lines 1 - 37	Aluminum Polyester Foil	1.90

All cable is 24 AWG Twisted pair construction. No Drain Wire. Standard RF Depot assemblies use crimp pins with only connected pins inserted. All cables are supplied with deep metal backshell and a straight clamp.

Shell Size	Receptacle (Female)			Plug (Male)		
	Designator+	Shell Part No.	Assembled Price	Designator+	Shell Part No.	Assembled Price
9	9S	C/E 11.3316	9.45	9P	C/E 11.3306	9.25
15	15S	C/E 11.3336	12.50	15P	C/E 11.3326	12.30
25	25S	C/E 11.3356	15.00	25P	C/E 11.3346	14.50
37	37S	C/E 11.3376	20.00	37P	C/E 11.3366	19.25

* Pins 8 & 20 are jumpered together at each connector unless otherwise specified. Add \$0.75 to each connector for jumpering

Receptacle Contact (Socket) is C/E 11.3145 - 05, (\$9.75/100pk) and Plug Contact Pin is C/E 11.341 - 05, (\$7.18/100pk). Plating is 0.000010 in gold over .000030 in nickel.

+ For right angle metal backshell suffix designator S becomes RS for Receptacle and designator P becomes RP for Plug.

Typical part number is assembled with: Cable Designator - Connector 1 Connector 2 - length in tenth's of inches.

An example of a part number for a 5 ft (60 inch), 6 conductor cable with a D9S right angle connector on one end and a D9P straight connector on the other is: 6 - D9RSD9P - 600.

For special cables or other cables with non standard pinning, markers, labeling or special packaging requirements, or combinations of different connectors the factory will create a drawing for customer approval and assign a special part number. Example: 7988-XXX.

SR = SEMIRIGID. A \$12.00 packing charge applies to 300' or less in 5 ft straight lengths. CO = Conformable ④
 ** QPL Full swept frequency in most cases
 Note: SEMIRIGID over 8 ft. long must ship via truck or be coiled. Some items 20' straight.

- ① Replaced by RG 178
- ② Bare Copper Braid
- ③ Bare Copper Center Conductor
- ④ Conformable is a Registered trademark of Belden Electronics Division

- ① Plain copper tube outer conductor
- ② Silver plated copper outer conductor
- ③ Tin plated copper outer conductor
- ④ Plain aluminum outer conductor
- ⑤ Tin plated aluminum outer conductor
- ⑥ Bare copper center conductor

- ⑦ Silver plated copper clad steel center conductor
- ⑧ Silver plated copper clad steel center conductor
- ⑨ Silver plated copper center conductor
- ⑩ Traditional hard temper copper outer
- ⑪ Modern soft temper copper outer

ENGINEERING NOTE: Bending Pre-terminated SEMIRIGID Coaxial Cables

Ref: Aluminum SEMIRIGID Cable

All cable cores move when coaxial cables are formed. The stronger jackets such as hard copper hold more tightly onto the core. This is a major difference between the "easy bend" cables and conventional cables.

Because of the weaker aluminum metal jacket, the cable core has lower adhesion to the aluminum outer conductor than to the copper outer conductor.

The core assembly moves in all short cables, aluminum and copper, from bending and temperature cycling.

Therefore, our standard procedure is to form cables before trimming. The bend in the cable minimizes the subsequent travel of the core.

We recommend that center pins of cables formed after connector installation be gauged and trimmed. The center pin can be from .075" to .100" long. RF Depot makes the center pin at .095" to allow for any movement. Larger movement has been known to result in damage to marginally constructed female contacts such as those found on coaxial switches. We have a specially modified pointing tool to shorten the long center pins.

Captivated coaxial connectors with internal socket contacts are often used to mitigate this problem. Such connectors, however, often increase the SWR and insertion loss at higher frequencies

All cables that are formed after terminating should have the center pin length measured and adjusted.

A rigid connector mated to the cable minimizes this problem. A "connector saver" can be used for this purpose. The Teflon® can most often be "pushed back" into the connector to improve the SWR and insertion loss.

If the pins are made shorter, the pin that recedes becomes too short.

In sum, we strongly recommend that cables be formed before termination whenever possible.
