

INTERSIL**DG139, DG142 — DG146,
DG161 — DG164****Drivers with Differentially Driven
N.O. and N.C. FET Switches****FEATURES**

- Each channel complete-interfaces with most integrated logic
- Low OFF power dissipation, 1 mW
- Switches analog signals up to 20 volts peak-to-peak
- Low $r_{DS(ON)}$, 10 ohms max on DG145 and DG146

GENERAL DESCRIPTION

Each package contains a monolithic driver with differential input and 2 or 4 discrete FET switches. The driver may be treated as a special purpose differential amplifier which controls the conduction state of the FET switches. The differential output of the driver sets the switches in opposition, one pair open and the other pair closed. All switches may be opened by applying a positive control signal to the V_R terminal.

SCHEMATIC AND LOGIC DIAGRAMS (Outline Dwgs DD, FD-2, JD)**ORDERING INFORMATION**

ABSOLUTE MAXIMUM RATINGS

$V^+ - V^-$	36V	$V^+ - V_R$	17V	Storage Temperature	-65 to +150°C
$V_S - V^-$	30V	$V^+ - V_{IN1}$ or V_{IN2}	14V	Operating Temperature	-55 to +125°C
$V^+ - V_S$	30V	$V_{IN1} - V_{IN2}$	±6V	Lead Temperature (soldering, 10 sec)	300°C
$V_S - V_D$	±22V	$V_{IN1} - V_R$	±6V		
$V_R - V^-$	21V	$V_{IN2} - V_R$	±6V		
Power Dissipation (Note)			750 mW	NOTE: Dissipation rating assumes device is mounted with all leads welded or soldered to printed circuit board in ambient temperature below 70°C. For higher temperature, derate at rate of 10 mW/°C.	
Current (any terminal)			30 mA		

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

3

Applied voltages for all tests: DG139, DG142, DG143, DG144, DG145, DG146 ($V^+ = 12V$, $V^- = -18V$, $V_R = 0$, $V_{IN2} = 2.5V$) and DG161, DG162, DG163, DG164 ($V^+ = 15V$, $V^- = -15V$, $V_R = 0$, $V_{IN2} = 2.5V$). Input test condition that guarantees FET switch ON or OFF as specified is used for output specifications.

NOTE1: An example of Absolute Minimum Differential Voltage, $|V_9 - V_{13}|$, is when $V_9 = 3V$ and $V_{13} = 2.5V$, the V_9 side of the switch is ON and the V_{13} side of the switch is OFF at 25°C. Conversely, when $V_9 = 2V$ and $V_{13} = 2.5V$, the V_9 side of the switch is OFF and the V_{13} side of the switch is ON at 25°C.
