

## DG180-191 High-Speed Driver With Junction FET Switches

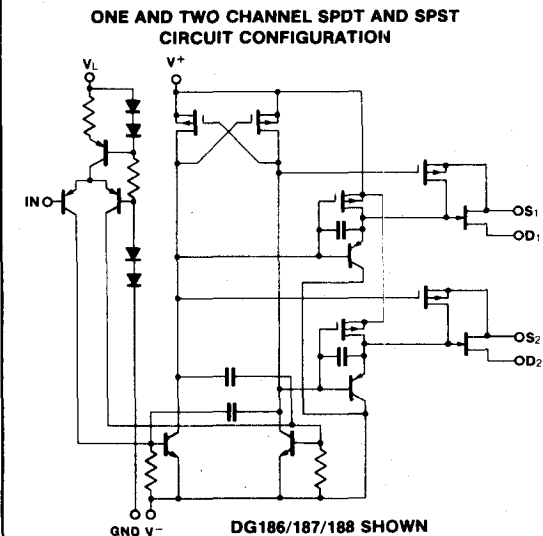

### FEATURES

- Constant ON-resistance for signals to  $\pm 10V$  (DG182, 185, 188, 191), to  $\pm 7.5V$  (all devices)
- $\pm 15V$  power supplies
- $< 2nA$  leakage from signal channel in both ON and OFF states
- TTL, DTL, RTL direct drive compatibility
- $t_{on}, t_{off} < 150ns$ , break-before-make action
- Cross-talk and open switch isolation  $> 50dB$  at 10MHz (75 $\Omega$  load)

### GENERAL DESCRIPTION

The DG180 thru DG191 series of analog gates consists of 2 or 4 N-channel junction-type field-effect transistors (J-FET) designed to function as electronic switches. Level-shifting drivers enable low-level inputs (0.8 to 2V) to control the ON-OFF state of each switch. The driver is designed to provide a turn-off speed which is faster than turn-on speed, so that break-before-make action is achieved when switching from one channel to another. In the ON state, each switch conducts current equally well in both directions. In the OFF condition, the switches will block voltages up to 20V peak-to-peak. Switch-OFF input-output feedthrough is  $> 50dB$  down at 10MHz, because of the low output impedance of the FET-gate driving circuit.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
