

ARITHMETIC LOGIC UNIT/FUNCTION GENERATOR

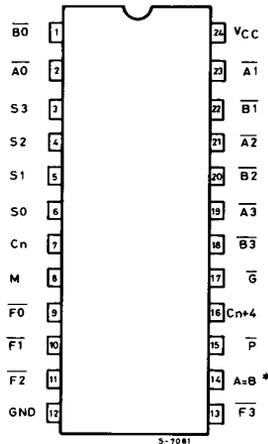

- **LOW POWER DISSIPATION**
 $I_{CC} = 4 \mu A$ (MAX.) at $T_A = 25^\circ C$
- **HIGH NOISE IMMUNITY**
 $V_{NIH} = V_{NIL} = 28\% V_{CC}$ (MIN.)
- **OUTPUT DRIVE CAPABILITY**
 10 LSTTL LOADS
- **SYMMETRICAL OUTPUT IMPEDANCE**
 $|I_{OH}| = I_{OL} = 6 \text{ mA}$ (MIN.)
- **BALANCED PROPAGATION DELAYS**
 $t_{PLH} = t_{PHL}$
- **WIDE OPERATING VOLTAGE RANGE**
 V_{CC} (OPR) = 2V to 6V
- **PIN AND FUNCTION COMPATIBLE**
 WITH 54/74LS181

DESCRIPTION

The M54/74HC181 is a high speed CMOS ARITHMETIC LOGIC UNIT/FUNCTION GENERATOR fabricated with silicon gate CMOS technology. It has the same high speed performance of SLTTL combined with true CMOS low power consumption. These circuits perform 16 binary arithmetic operations on two 4-bit words as shown in Tables 1 and 2. These operations are selected by the four function-select lines (S0, S1, S2, S3) and include addition, subtraction, decrement, and straight transfer. When performing arithmetic manipulations, the internal carries must be enabled by applying a low-level voltage to the mode control input (M). A full carry look-ahead scheme is made available in these devices for fast, simultaneous carry generation by means of two cascade-outputs (pins 15 and 17) for the four bits in the package. When used in conjunction with the M54HC182 or M74HC182, full carry look-ahead circuits, high-speed arithmetic operations can be performed. These circuits will accommodate active-high or active-low data, if the pin designations are interpreted as shown below. Subtraction is accomplished by 1's complement addition where the 1's complement of the subtrahend is generated internally. The resultant output is $1-B-1$, which requires an end-around or forced carry to produce $A-B$. The 181 can also be utilized as a comparator. The $A=B$ output is internally decoded from the function outputs (F0, F1, F2, F3) so that when two words of equal magnitude are applied at the A and B inputs, it will assume a high level to indicated equality ($A=B$).

PIN CONNECTIONS (top view)

*: Open drain Output Structure

DESCRIPTION (Continued)

The ALU should be in the subtract mode with $C_n = H$ when performing this comparison. The $A = B$ output is open-drain so that it can be wire-AND connected to give a comparison for more than four bits. The carry output ($C_n + 4$) can also be used to supply relative magnitude information. Again, the ALU should be placed in the subtract mode by placing the function select inputs S_3, S_2, S_1, S_0 at L, H, H, L, respectively. These circuits have been designed to not only incorporate all of the desi-

gnier's requirements for arithmetic operations, but also to provide 16 possible functions of two Boolean variables without the use of external circuitry. These logic functions are selected by use of the four function-select inputs (S_0, S_1, S_2, S_3) with the mode-control input (M) at a high level to disable the internal carry. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

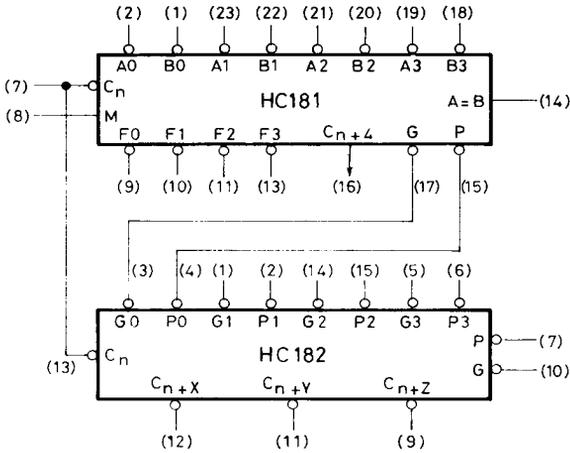

PIN DESIGNATIONS

| Designations | Pin No. | Function |
|--|---------------|------------------------|
| $\overline{A_0}, \overline{A_1}, \overline{A_2}, \overline{A_3}$ | 2, 23, 21, 19 | Word A Inputs |
