#### DESCRIPTION

The HCT240, HCT241 and HCT244 are high speed CMOS OCTAL BUS BUFFER's fabricated with silicon C<sup>2</sup>MOS technology.

These devices may be used as a level converter for interfacing TTL or NMOS to High Speed CMOS. The inputs are compatible with TTL, NMOS and CMOS output voltage levels.

They achieve the high speed operation similar to equivalent LSTTL while maintaining the CMOS low power dissipation.

The designer has a choice of selected combinations of inverting and noninverting outputs, symmetrical G (active-low output control) inputs, and complementary G and  $\bar{G}$  inputs. Each control input governs four BUS BUFFERs.

These devices are designated to be used with 3-state memory address drivers, etc. All inputs are equipped with protection circuits against static discharge and transient excess voltage.
