DESCRIPTION

The M54/74HC298 is a high speed CMOS QUAD 2-CHANNEL MULTIPLEXER/REGISTER fabricated in silicon gate CMOS technology. It has the same high speed performance of LSTTL combined with true CMOS low power consumption. These circuits are controlled by the signals WORD SELECT and CLOCK. When the WORD SELECT input is taken low Word 1 (A1, B1, C1 and D1) is presented to the input of the flip-flops, and when WORD SELECT is high Word 2 (A2, B2, C2 and D2) is presented to the inputs of the flip-flops. The select word is clocked to the output terminals on the negative edge of the clock pulse. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

Average operating current can be obtained from the equation: $I_{CC(opr.)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/4$ (per bit)

And the C_{PD} for the operating n-bit can be obtained by the following equation: $C_{PD} = 32 + n \cdot 15$
