DESCRIPTION

The UA776 programmable operational amplifier is characterized by, low supply current and low input noise over a wide range of operating supply voltages.

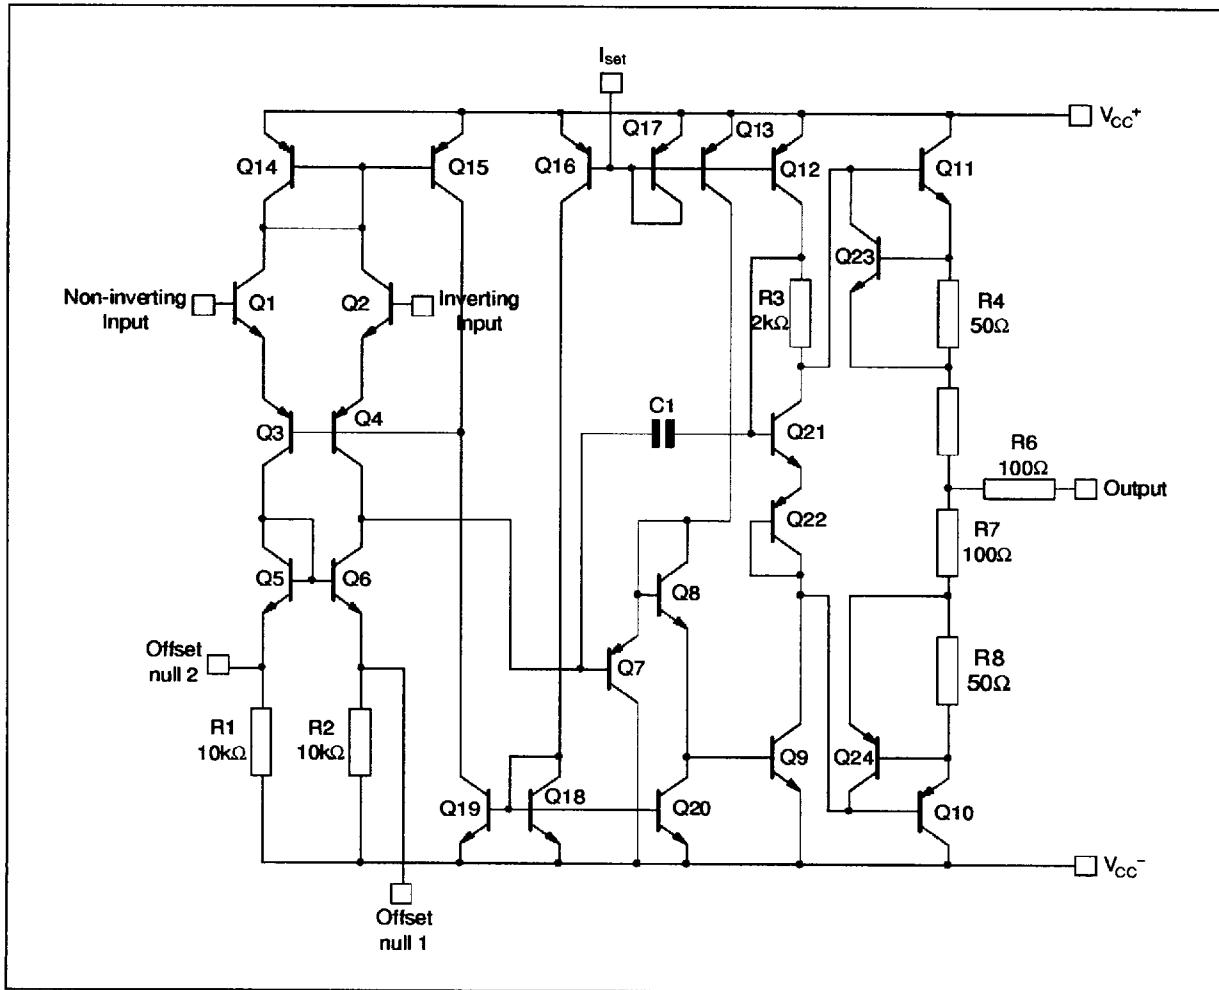

Coupled with programmable electrical characteristics, it is an extremely versatile amplifier for use in high accuracy, low power consumption analog applications.

Input noise voltage and current, power consumption, and input current can be optimized by a single resistor or current source that sets the chip quiescent current for nano-watt power consumption or for characteristics similar to the UA741.

Internal frequency compensation, absence of latch up, high slew rate and short-circuit protection assure ease of use in long time integrators, active filters, and sample and hold circuits.
