

**HIGH VOLTAGE
HIGH-SIDE DRIVER**
PRODUCT PREVIEW

- V_{H.V.} UP TO 600 V
- SUPPLY VOLTAGE UP TO 17 V
- DRIVER CURRENT CAPABILITY:
SINK CURRENT = 200 mA
SOURCE CURRENT = 100 mA
- UNDER VOLTAGE LOCKOUT WITH HYSTERESIS
- CMOS/LSTTL COMPATIBLE INVERTING INPUT
- dV/dt IMMUNITY ± 50 V/nS IN FULL TEMPERATURE RANGE
- CURRENT MODE CONTROL REFERENCE INPUT
- CURRENT/VOLTAGE MODE OPERATION (L6380)
- VOLTAGE MODE OPERATION (L6381)
- 8 PINS PACKAGE

DESCRIPTION

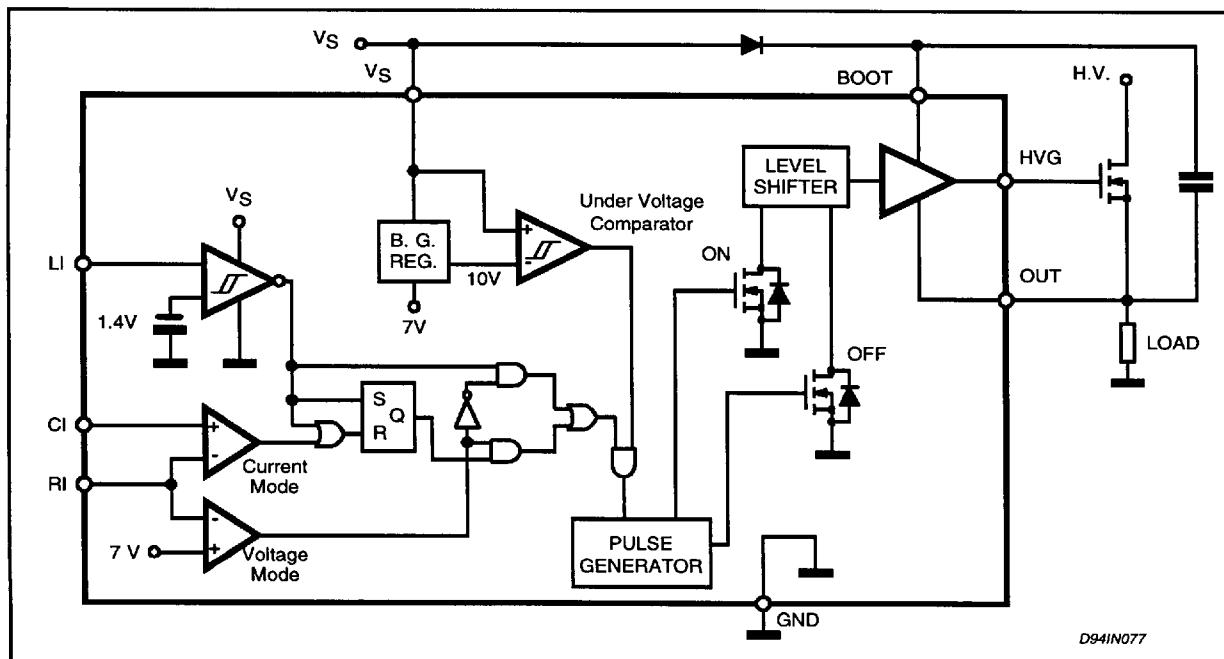

The L6380/L6381 is an high-voltage device with a

driving stage floating up to 500V.

It can be used to drive N-channel power MOSFET and IGBT, in high-side and low-side configurations.

The device has a logic input (CMOS and LSTTL compatible) and two comparator inputs compatible to ground.

L6380 BLOCK DIAGRAM

D94IN077

To drive the external power device the signal coming from input logic is fed into a pulse generator that in turns drives the level shifting structure (that include two High Voltage DMOS) designed to ensure low power dissipation and high noise immunity. The output buffer (in Totem Pole arrangement) is able to sink from or source to the gate of the external device the current needed to switch it ON or OFF.

The falling edge of the signal coming from the input logic will turn ON while the rising edge will turn OFF the driven power device. This operation will ensure low current sinking from the HV rail during commutations.

Current / Voltage Mode Operation

To select the Voltage Mode Operation the user have to set on the RI pin a voltage higher than the internal reference (7V). In this way the IC will function as an inverting buffer driven by the LI input pin (see Voltage Mode Timing Diagram).

If the voltage on RI input pin is lower than 7V the Current Mode Operation will be enabled. In this configuration the RI input will set the reference

voltage to the non inverting input of the Current Mode Comparator (see block diagram), whose inverting input, the CI input pin, in allowable to close a current control loop with a voltage drop coming from a sense resistor. To summarise (see Current Mode Timing Diagrams):

The output of the Current Mode Comparator will mask the LI input whenever the CI voltage is higher than the RI input (and the RI voltage is below 7V).

Under Voltage Lockout

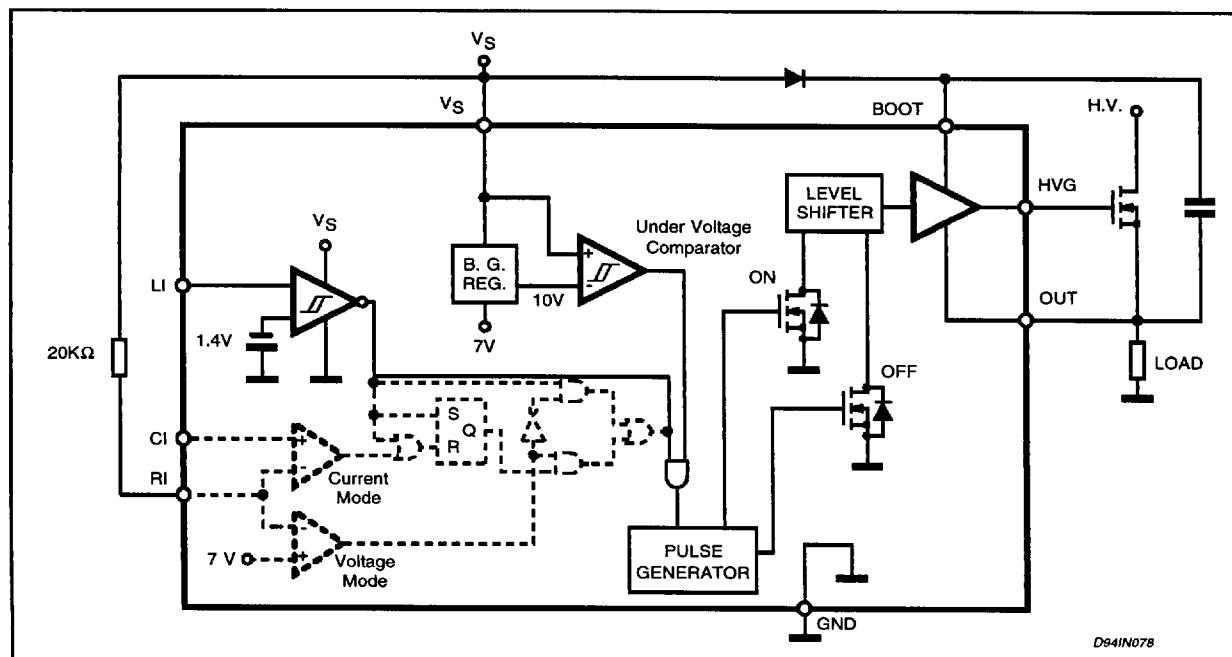

The output buffer if switched off whenever Vs decrease below Vth OFF.

The IC will remain in this shut down status until Vs has risen above VthON, the hysteresis will provide a good noise immunity.

Applications

The L6380/L6381 can be used in motor control applications (AC, DC and switched reluctance), electronic ballasts, heating and welding, switching power supplies and UPS.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{BOOT}	Supply voltage of bootstrapped section	600+Vs	V
V _{HVG}	Gate voltage of upper driver	600+Vs	V
V _{OUT}	Output voltage	600	V
V _{BOOT} - V _{OUT}	Difference between boot voltage and output voltage	18	V
V _{HVG} - V _{OUT}	Difference between gate voltage of upper gate and output voltage	18	V
V _S	Supply voltage	18	V
V _{IN}	Input voltage	V _S	V
dV _{OUT} /dt	Transient offset supply voltage	±50	V/ns
V _{OUT} - V _{GND}	Difference between output voltage and ground ($t_p \leq 100$ ns)	-10	V
T _{amb}	Ambient Temperature Range (operative)	-25 to +85	°C
T _J	Junction temperature	150	°C
T _{ST}	Storage temperature	-40 to +150	°C
P _{tot}	Total Power Dissipation (at T _j = 85°C)	650	mW

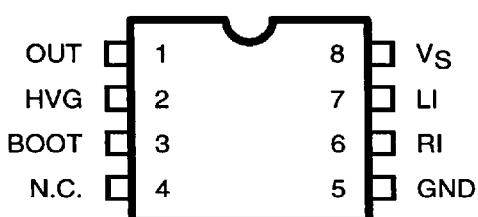

THERMAL DATA
