

**16K ROM HCMOS MCU  
WITH EEPROM, RAM AND A/D CONVERTER**

- Register oriented 8/16 bit CORE with RUN, WFI and HALT modes
- Minimum instruction cycle time : 500ns (12MHz internal)
- Internal Memory :

ROM	16K bytes
RAM	256 bytes
EEPROM	512 bytes

224 general purpose registers available as RAM, accumulators or index registers (register file)
- 80-pin PQFP package for ST9040Q
- 68-lead PLCC package for ST9040C
- DMA controller, Interrupt handler and Serial Peripheral Interface as standard features
- Up to 56 fully programmable I/O pins
- Up to 8 external plus 1 non-maskable interrupts
- 16 bit Timer with 8 bit Prescaler, able to be used as a Watchdog Timer
- Two 16 bit Multifunction Timers, each with an 8 bit prescaler and 13 operating modes
- 8 channel 8 bit Analog to Digital Converter, with Analog Watchdogs and external references
- Serial Communications Interface with asynchronous and synchronous capability
- Rich Instruction Set and 14 Addressing modes
- Division-by-Zero trap generation
- Versatile development tools, including assembler, linker, C-compiler, archiver, graphic oriented debugger and hardware emulators
- Real Time Operating System
- Windowed and One Time Programmable EPROM parts available for prototyping and pre-production development phases
- Pin to pin compatible with ST9036

## 1.1 GENERAL DESCRIPTION

The ST9040 is a ROM member of the ST9 family of microcontrollers, completely developed and produced by SGS-THOMSON Microelectronics using a proprietary n-well HCMOS process.

The ST9040 peripheral and functional actions are fully compatible throughout the ST903x/4x family. This datasheet will thus provide only information specific to this ROM device.

**THE READER IS ASKED TO REFER TO THE DATASHEET OF THE ST9036 ROM-BASED DEVICE FOR FURTHER DETAILS.**

The nucleus of the ST9040 is the advanced Core which includes the Central Processing Unit (CPU), the Register File, a 16 bit Timer/Watchdog with 8 bit Prescaler, a Serial Peripheral Interface supporting S-bus, I<sup>2</sup>C-bus and IM-bus Interface, plus two 8 bit I/O ports. The Core has independent memory and register buses allowing a high degree of pipelining to add to the efficiency of the code execution speed of the extensive instruction set. The powerful I/O capabilities demanded by microcontroller applications are fulfilled by the ST9040 with up to 56 I/O lines dedicated to digital Input/Output. These lines are grouped into up to seven 8 bit I/O Ports and can be configured on a bit basis under

software control to provide timing, status signals, an address/databus for interfacing external memory, timer inputs and outputs, analog inputs, external interrupts and serial or parallel I/O with or without handshake.

Three basic memory spaces are available to support this wide range of configurations: Program Memory (internal and external), Data Memory (internal and external) and the Register File, which includes the control and status registers of the on-chip peripherals.

Two 16 bit MultiFunction Timers, each with an 8 bit Prescaler and 13 operating modes allow simple use for complex waveform generation and measurement, PWM functions and many other system timing functions by the usage of the two associated DMA channels for each timer. In addition there is an 8 channel Analog to Digital Converter with integral sample and hold, fast 11  $\mu$ s conversion time and 8 bit resolution. An Analog Watchdog feature is included for two input channels.

Completing the device is a full duplex Serial Communications Interface with an integral 110 to 375,000 baud rate generator, asynchronous and 1.5Mbyte/s synchronous capability (fully programmable format) and associated address/wake-up option, plus two DMA channels.

## 1.2 PIN DESCRIPTION

**AS.** *Address Strobe (output, active low, 3-state).* Address Strobe is pulsed low once at the beginning of each memory cycle. The rising edge of  $\overline{AS}$  indicates that address, Read/Write (R/W), and Data Memory signals are valid for program or data memory transfers. Under program control,  $\overline{AS}$  can be placed in a high-impedance state along with Port 0 and Port 1, Data Strobe ( $\overline{DS}$ ) and R/W.

**DS.** *Data Strobe (output, active low, 3-state).* Data Strobe provides the timing for data movement to or from Port 0 for each memory transfer. During a write cycle, data out is valid at the leading edge of  $\overline{DS}$ . During a read cycle, Data In must be valid prior to the trailing edge of  $\overline{DS}$ . When the ST9040 accesses on-chip memory,  $\overline{DS}$  is held high during the whole memory cycle. It can be placed in a high impedance state along with Port 0, Port 1,  $\overline{AS}$  and R/W.

**R/W.** *Read/Write (output, 3-state).* Read/Write determines the direction of data transfer for external memory transactions. R/W is low when writing to external program or data memory, and high for all other transactions. It can be placed in a high impedance state along with Port 0, Port 1,  $\overline{AS}$  and  $\overline{DS}$ .

**RESET.** *Reset (input, active low).* The ST9 is initialised by the Reset signal. With the deactivation of RESET, program execution begins from the Program memory location pointed to by the vector contained in program memory locations 00h and 01h.

**INT0, INT7.** External interrupts (input, active on rising or falling edge). External interrupt inputs 0 and

7 respectively. INT0 channel may also be used for the timer watchdog interrupt.

**OSCIN, OSCOUT.** *Oscillator (input and output).* These pins connect a parallel-resonant crystal (24MHz maximum), or an external source to the on-chip clock oscillator and buffer. OSCIN is the input of the oscillator inverter and internal clock generator; OSCOUT is the output of the oscillator inverter.

**AVDD.** Analog  $V_{DD}$  of the Analog to Digital Converter.

**AVSS.** Analog  $V_{SS}$  of the Analog to Digital Converter. *Must be tied to  $V_{SS}$ .*

**VDD.** Main Power Supply Voltage ( $5V \pm 10\%$ )

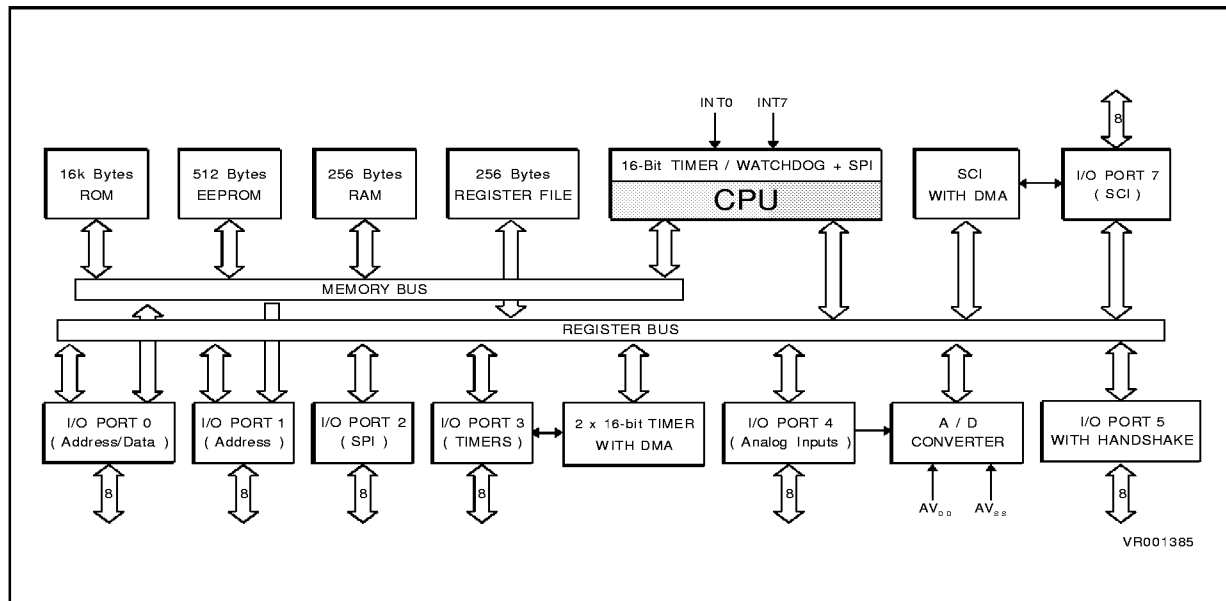

**VSS.** Digital Circuit Ground.

**P0.0-P0.7, P1.0-P1.7, P2.0-P2.7 P3.0-P3.7, P4.0-P4.7, P5.0-P5.7, P7.0-P7.7** *I/O Port Lines (Input/Output, TTL or CMOS compatible).* 56 lines grouped into I/O ports of 8 bits, bit programmable under program control as general purpose I/O or as alternate functions.

### 1.2.1 I/O Port Alternate Functions

Each pin of the I/O ports of the ST9040 may assume software programmable Alternative Functions as shown in the Pin Configuration Drawings. Table 1-3 shows the Functions allocated to each I/O Port pins and a summary of packages for which they are available.

Figure 3. ST9040 Block Diagram

### 1.3 MEMORY

#### 1.3.1 INTRODUCTION

The memory of the ST9 is divided into two spaces:

- Data memory with up to 64K (65536) bytes
- Program memory with up to 64K (65536) bytes

Thus, there is a total of 128K bytes of addressable memory space.

The 16K bytes of on-chip ROM memory of the ST9040 are selected at memory addresses 0 through 3FFFh (hexadecimal) in the PROGRAM space.

The DATA space includes the 512 bytes of on-chip EEPROM at addresses 0 through 1FFh and the 256 bytes of on-chip RAM memory at addresses 200h through 2FFh.

#### 1.3.2 EEPROM

##### 1.3.2.1 Introduction

The EEPROM memory provides user-programmable non-volatile memory on-chip, allowing fast and reliable storage of user data. As there is also no off-chip access required, as for an external serial EEPROM, high security levels can be achieved.

The EEPROM memory is read as normal RAM memory at Data Space addresses 0 to 1FFh, however one WAIT cycle is automatically added for a Read cycle, while a byte write cycle to the

EEPROM will cause the start of an ERASE/WRITE cycle at the addressed location. Word (16 bit) writes are not allowed.

The programming cycle is self-timed, with a typical programming time of 6ms. The voltage necessary for programming the EEPROM is internally generated with a +18V charge pump circuit.

Up to 16 bytes of data may be programmed into the EEPROM during the same write cycle by using the PARALLEL WRITE function.

A standby mode is also available which disables all power consumption sources within the EEPROM for low power requirements. When STBY is high, any attempt to access the EEPROM memory will produce unpredictable results. After the re-enabling of the EEPROM, a delay of 6 INTCLK cycles must be allowed before the selection of the EEPROM.

The EEPROM of the ST9040 has been implemented in a high reliability technology developed by SGS-THOMSON, this, together with the double bit structure, allow 300k Erase/Write cycles and 10 year data retention to be achieved on a microcontroller.

Control of the EEPROM is performed through one register mapped at register address R241 in Page 0.

Figure 1-4. Memory Map

## EEPROM (Continued)

**1.3.2.2 EEPROM Programming Procedure**

The programming of a byte of EEPROM memory is equivalent to writing a byte into a RAM location after verifying that EEBUSY bit is low. Instructions operating on word data (16 bits) will not access the EEPROM.

The EEPROM ENABLE bit EEWEN must first be set before writing to the EEPROM. When this bit is low, attempts to write data to the EEPROM have no affect, this prevents any spurious memory accesses from affecting the data in the EEPROM.

Termination of the write operation can be detected by polling on the EEBUSY status bit, or by interrupt, taking the interrupt vector from the External Interrupt 4 channel. The selection of the interrupt is made by EEPROM Interrupt enable bit EEIEN. It should be noted that the Mask bit of External Interrupt 4 should be set, and the Interrupt Pending bit reset, before the setting of EEIEN to prevent unwanted interrupts. A delay (eg a `nop` instruction) should also be included between the operations on the mask and pending bits of External Interrupt 4.

If polling on EEBUSY is used, a delay of 6 INTCLK clock cycles is necessary after the end of programming, this can be a `nop` instruction or, normally, the required time to test the EEBUSY bit and to branch to the next instruction will be sufficient. While EEBUSY is active, any attempt to access the EEPROM matrix will be aborted and the data read will be invalid. EEBUSY is a read only bit and cannot be reset by the user if active.

An erased bit of the EEPROM memory will read as a logic "0", while a programmed cell will be read as a logic "1". For applications requiring the highest level of reliability, the Verify Mode, set by EEPROM control register bit VRFY, allows the reading of the EEPROM memory cells with a reduced gate voltage (typically 20%). If the EEPROM memory cell has been correctly programmed, a logic "1" will be read with the reduced voltage, otherwise a logic "0" will be read.

**1.3.2.3 Parallel Programming Procedure**

Parallel programming is a feature of the EEPROM macrocell. One up to sixteen bytes of a same row can be programmed at once.

The constraint is that each of the bytes occur in the same ROW of the EEPROM memory (A4 constant, A3-A0 variable). To operate this mode, the Parallel Mode enable bit, PLEN, must be set. The data written is then latched into buffers (at the addresses specified, which may be non-sequential) and then transferred to the EEPROM memory by the setting of the PLLST bit of the control register. Both PLLST and PLEN are internally reset at the end of the programming cycle. Any attempt to read the EEPROM memory when PLEN is set will give invalid data. In the event that the data in the buffer latches is not required to be written into the memory by the setting of PLLST, the correct way to terminate the operation is to reset PLEN and to perform a dummy read of the EEPROM memory. This termination will clear all data present in the latches.

**1.3.2.4 EEPROM Programming Voltage**

No external Vpp voltage is required, an internal 18Volt charge-pump gives the required energy by a dedicated oscillator pumping at a typical frequency of 5MHz, regardless of the external clock.

**1.3.2.5 EEPROM Programming Time**

No timing routine is required to control the programming time as dedicated circuitry takes care of the EEPROM programming time (The typical programming time is 6ms).

**1.3.2.6 EEPROM Interrupt Management**

At the end of each write procedure the EEPROM sends an interrupt request (if EEIEN bit is set). The EEPROM shares its interrupt channel with the external interrupt source INT4, from which the priority level is derived.

Care must be taken when EEIEN is reset. The associated external interrupt channel must be disabled (by resetting bit 4 of EIMR, R244) along with resetting the interrupt pending bit (bit 4 of EIPR, R243) to prevent unwanted interrupts. A delay instruction (at least 1 `nop` instruction) must be inserted between these two operations

**WARNING.** The content of the EEPROM of the ST9040 family after the out-going test at SGS-THOMSON's manufacturing location is not guaranteed.

## EEPROM (Continued)

## 1.3.2.7 EEPROM Control Register

EECR R241 (F1h) Page 0 Read/Write

(except EEBUSY: read only)

EEPROM Control Register

Reset value : 0000 0000b (00h)

7							0
0	VERIFY	EESTBY	EEIEN	PLLST	PLEN	EEBUSY	EEWEN

bit 7 = **B7**: This bit is forced to "0" after reset and **MUST** not be modified by the user.

bit 6 = **VERIFY**: *Set Verify mode*. Verify (active high) is used to activate the verify mode.

The verify mode provides a guarantee of good retention of the programmed bit. When active, the reading voltage on the cell gate is decreased from 1.2V to 0.0V, decreasing the current from the programmed cell by 20%. If the cell is well programmed (to "1"), a "1" will still be read, otherwise a "0" will be read.

**Note**. The verify mode must not be used during an erasing or a programming cycle).

bit 5 = **EESTBY**: *EEPROM Stand-By*. EESTBY = "1" switches off all power consumption sources inside the EEPROM. Any attempt to access the EEPROM when EESTBY = "1" will produce unpredictable results.

**Note**. After EESTBY is reset, the user must wait 6 CPUCLK cycles (e.g. 1 *nop* instruction) before selecting the EEPROM.

bit 4 = **EEIEN**: *EEPROM Interrupt Enable*. INTEN = "1" disables the external interrupt source INT4, and enables the EEPROM to send its interrupt request to the central interrupt unit at the end of each write procedure.

bit 3 = **PLLST**: *Parallel Write Start*. Setting PLLST to "1" starts the parallel writing procedure. It can be set only if PLEN is already set. PLLST is internally reset at the end of the programming sequence.

bit 2 = **PLEN**: *Parallel write Enable*. Setting PLEN to "1" enables the parallel writing mode which allows the user to write up to 16 bytes at the same time. PLEN is internally reset at the end of the programming sequence.

bit 1 = **EEBUSY**: *BUSY*. When this read only bit is high, an EEPROM write operation is in progress and any attempt to access the EEPROM is aborted.

bit 0 = **EEWEN**: *EEPROM Write Enable*. Setting this bit allows programming of the EEPROM, when low a writing attempt has no effect.

## 1.3.3 REGISTER MAP

Please refer to the Register Map of the ST9036 for all general registers with the exception of the register shown in the following table.

Table 1-5. Register Map Addendum

EECR	R241	(F1h)	Page 0	Read/Write	Control Registers
------	------	-------	--------	------------	-------------------

Figure 1-5. EEPROM Parallel Programming Rows

## 2 ELECTRICAL CHARACTERISTICS

### ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	- 0.3 to 7.0	V
$AV_{DD}$ , $AV_{SS}$	Analog Supply Voltage	$V_{SS} = AV_{SS} < AV_{DD} \leq V_{DD}$	V
$V_I$	Input Voltage	- 0.3 to $V_{DD} + 0.3$	V
$V_O$	Output Voltage	- 0.3 to $V_{DD} + 0.3$	V
$T_{STG}$	Storage Temperature	- 55 to + 150	°C
$I_{INJ}$	Pin Injection Current Digital Input	-5 to +5	mA
$I_{INJ}$	Pin Injection Current Analog Input	-5 to +5	mA
	Maximum Accumulated Pin injection Current in the device	-50 to +50	mA

**Note:** Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. All voltages are referenced to VSS

### RECOMMENDED OPERATING CONDITIONS

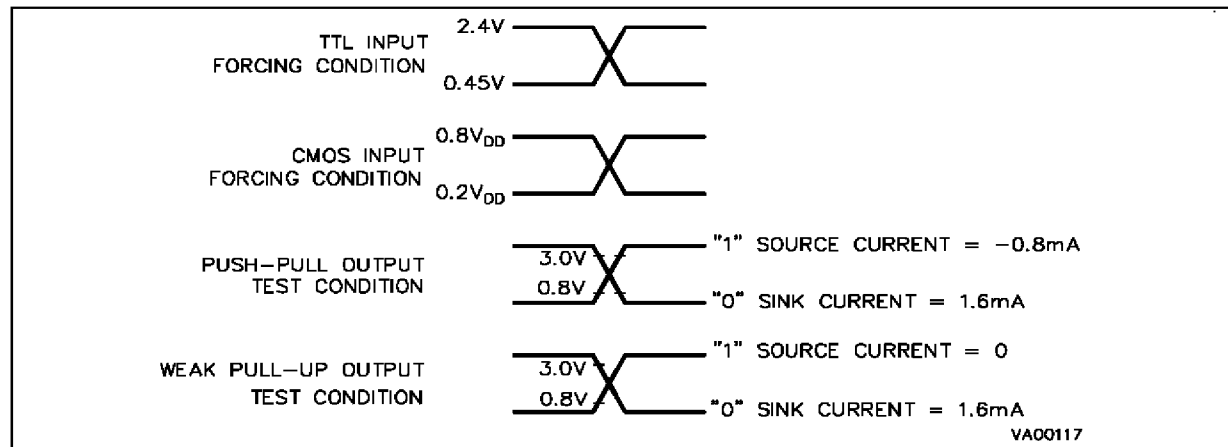

Symbol	Parameter	Value		Unit
		Min.	Max.	
$T_A$	Operating Temperature	- 40	85	°C
$V_{DD}$	Operating Supply Voltage	4.5	5.5	V
$f_{OSCE}$	External Oscillator Frequency		24	MHz
$f_{OSCI}$	Internal Clock Frequency (INTCLK)		12	MHz

**DC ELECTRICAL CHARACTERISTICS**

$V_{DD} = 5V \pm 10\%$   $T_A = -40^\circ C$  to  $+85^\circ C$ , unless otherwise specified)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
$V_{IHCK}$	Clock Input High Level	External Clock	$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{ILCK}$	Clock Input Low Level	External Clock	-0.3		$0.3 V_{DD}$	V
$V_{IH}$	Input High Level	TTL	2.0		$V_{DD} + 0.3$	V
		CMOS	$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{IL}$	Input Low Level	TTL	-0.3		0.8	V
		CMOS	-0.3		$0.3 V_{DD}$	V
$V_{IHRS}$	$\overline{RESET}$ Input High Level		$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{ILRS}$	$\overline{RESET}$ Input Low Level		-0.3		$0.3 V_{DD}$	V
$V_{HYRS}$	$\overline{RESET}$ Input Hysteresis		0.3		1.5	V
$V_{OH}$	Output High Level	Push Pull, $I_{load} = -0.8mA$	$V_{DD} - 0.8$			V
$V_{OL}$	Output Low Level	Push Pull or Open Drain, $I_{load} = 1.6mA$			0.4	V
$I_{WPU}$	Weak Pull-up Current	Bidirectional Weak Pull-up, $V_{OL} = 0V$	-50	-200	-420	$\mu A$
$I_{APU}$	Active Pull-up Current, for INT0 and INT7 only	$V_{IN} < 0.8V$ , under Reset	-80	-200	-420	$\mu A$
$I_{LKIO}$	I/O Pin Input Leakage	Input/Tri-State, $0V < V_{IN} < V_{DD}$	-10		+10	$\mu A$
$I_{LKRS}$	$\overline{Reset}$ Pin Input Leakage	$0V < V_{IN} < V_{DD}$	-30		+30	$\mu A$
$I_{LKAD}$	A/D Pin Input Leakage	Alternate Function, Open Drain, $0V < V_{IN} < V_{DD}$	-3		+3	$\mu A$
$I_{LKAP}$	Active Pull-up Input Leakage	$0V < V_{IN} < 0.8V$	-10		+10	$\mu A$
$I_{LKOS}$	OSCIN Pin Input Leakage	$0V < V_{IN} < V_{DD}$	-10		+10	$\mu A$

**Note:** All I/O Ports are configured in Bidirectional Weak Pull-up Mode with no DC load, External Clock pin (OSCIN) is driven by square wave external clock. No peripheral working.

**DC TEST CONDITIONS**

**AC ELECTRICAL CHARACTERISTICS**(V<sub>DD</sub> = 5V ± 10% T<sub>A</sub> = – 40 °C to + 85°C, unless otherwise specified)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
I <sub>DD</sub>	Run Mode Current no CPUCLK prescale, Clock divide by 2	24MHz, Note 1			40	mA
I <sub>DP2</sub>	Run Mode Current Prescale by 2 Clock divide by 2	24MHz, Note 1			30	mA
I <sub>WFI</sub>	WFI Mode Current no CPUCLK prescale, Clock divide by 2	24MHz, Note 1			20	mA
I <sub>HALT</sub>	HALT Mode Current	24MHz, Note 1			100	μA

Note 1: All I/O Ports are configured in Bidirectional Weak Pull-up Mode with no DC load, External Clock pin (OSCIN) is driven by square wave external clock. No peripheral working.

**CLOCK TIMING TABLE**(V<sub>DD</sub> = 5V ± 10%, T<sub>A</sub> = - 40°C to + 85°C, INTCLK = 12MHz, unless otherwise specified)

N°	Symbol	Parameter	Value		Unit	Note
			Min.	Max.		
1	TpC	OSCIN Clock Period	41.5		ns	1

			Min.	Max.	Min.	Max.	Min.	Max.	
1	$T_{W_{EXT}}$	CE <sub>n</sub> Pulse width (1)	$276n \times T_{pc}$		$138n \times T_{pc}$		$n \times 11.5$	-	$\mu s$

## Notes:

1.  $n$  = number of autoscanned channels ( $1 < n < 8$ )
2. Variable clock ( $T_{pc}$  = OSCIN clock period)
3. CPUCLK = 12MHz

## A/D CHANNEL ENABLE TIMING

## A/D ANALOG SPECIFICATIONS

Parameter	Typical (1)	Minimum	Maximum	Units (2)	Notes
Analog Input Range $A_{VCC}$		3	$A_{VCC}$ $V_{CC}$	V	
Conversion time		11.5		$\mu s$	(3, 4)
Sample time		3		$\mu s$	(3)
Power-up time		60		$\mu s$	
Resolution	8	8		$\beta_{1\tau\sigma}$	
Monotonicity	GUARANTEED				
No missing codes	GUARANTEED				
Zero input reading		00		Hex	
Full scale reading			FF	Hex	
Offset error	.5		1	LSBs	(2,6)
Gain error	.5		1	LSBs	(6)
Diff. Non Linearity	$\pm 3$	$\pm 2$	$\pm 5$	LSBs	(6)
Int. Non Linearity			1	LSBs	(6)
Absolute Accuracy			1	LSBs	(6)
S/N		45	49	dB	
$A_{VCC}/A_{VSS}$ Resistance	13.5	16	11	K $\Omega$	
Input Resistance	12	8	15	K $\Omega$	(5)
Hold Capacitance			30	pF	
Input Leakage			$\pm 3$	$\mu A$	

## Notes:

- The values are expected at 25 degree Centigrade with  $A_{VCC} = 5V$
- "LSBs", as used here, has a value of  $A_{VCC}/256$
- @ 12MHz internal clock
- Including sample time
- It must be intended as the internal series resistance before the sampling capacitor
- This is a typical expected value, but not a tested production parameter.  
If  $V(i)$  is the value of the i-th transition level ( $0 < i < 254$ ), the performance of the A/D converter has been valued as follows:  
 OFFSET ERROR = deviation between the actual  $V(0)$  and the ideal  $V(0)$  (=1/2 LSB)  
 GAIN ERROR = deviation between the actual  $V(254)$  and the ideal  $V(254)$  (=  $A_{VCC}-3/2$  LSB)  
 DNL ERROR =  $\max \{ [V(i) - V(i-1)] / \text{LSB} - 1 \}$   
 INL ERROR =  $\max \{ [V(i) - V(0)] / \text{LSB} - i \}$

## MULTIFUNCTION TIMER UNIT EXTERNAL TIMING TABLE

N°	Symbol	Parameter	OSCIN Divided by 2 (3)	OSCIN Not Divided by 2 (3)	Value (4)		Unit	Note
					Min.	Max.		
1	$T_{WCTW}$	External clock/trigger pulse width	$2n \times T_{pc}$	$n \times T_{pc}$	$n \times 83$	-	ns	1
2	$T_{WCTD}$	External clock/trigger pulse distance	$2n \times T_{pc}$	$n \times T_{pc}$	$n \times 83$	-	ns	1
3	$T_{WAED}$	Distance between two active edges	$6 \times T_{pc}$	$3 \times T_{pc}$	249	-	ns	
4	$T_{WGW}$	Gate pulse width	$12 \times T_{pc}$	$6 \times T_{pc}$	498	-	ns	
5	$T_{WLBA}$	Distance between TINB pulse edge and the following TINA pulse edge	$2 \times T_{pc}$	$T_{pc}$	83	-	ns	2
6	$T_{WLAB}$	Distance between TINA pulse edge and the following TINB pulse edge	0		0	-	ns	2
7	$T_{WAD}$	Distance between two TxINA pulses	0		0	-	ns	2
8	$T_{WOWD}$	Minimum output pulse width/distance	$6 \times T_{pc}$	$3 \times T_{pc}$	249	-	ns	

## Notes:

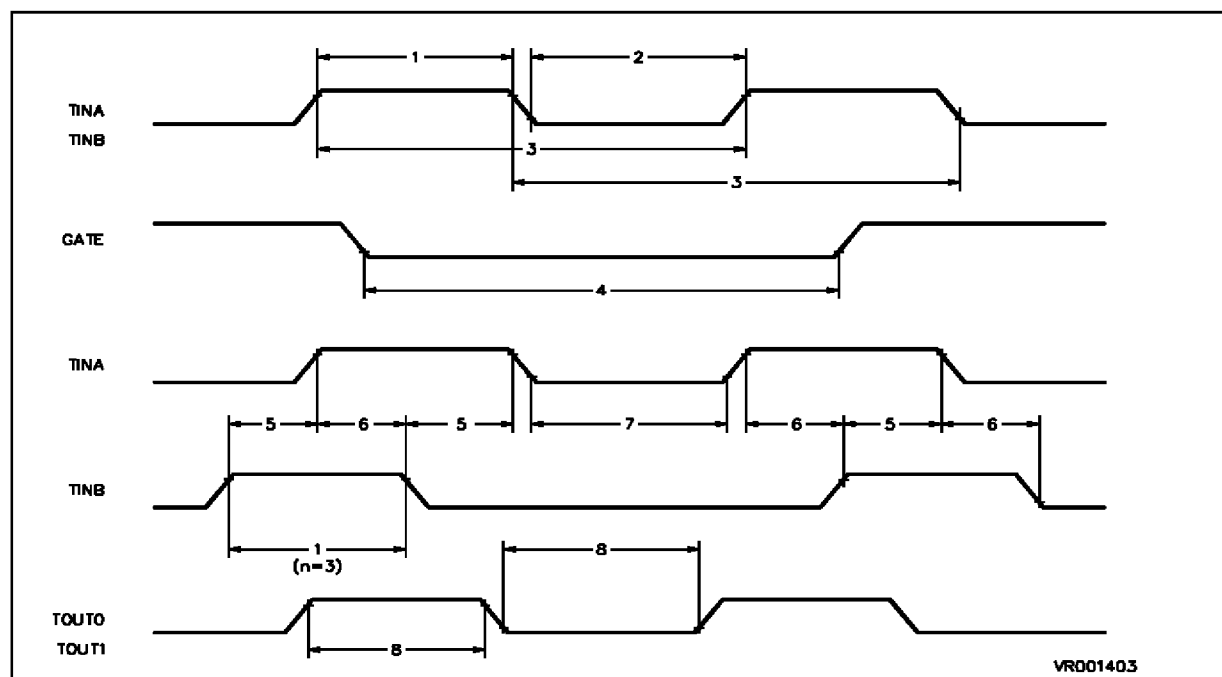

1.  $n = 1$  if the input is rising OR falling edge sensitive  
 $n = 3$  if the input is rising AND falling edge sensitive

2. In Autodiscrimination mode

3. Variable clock ( $T_{pc} = \text{OSCIN period}$ )

4.  $\text{INTCLK} = 12 \text{ MHz}$

## MULTIFUNCTION TIMER UNIT EXTERNAL TIMING

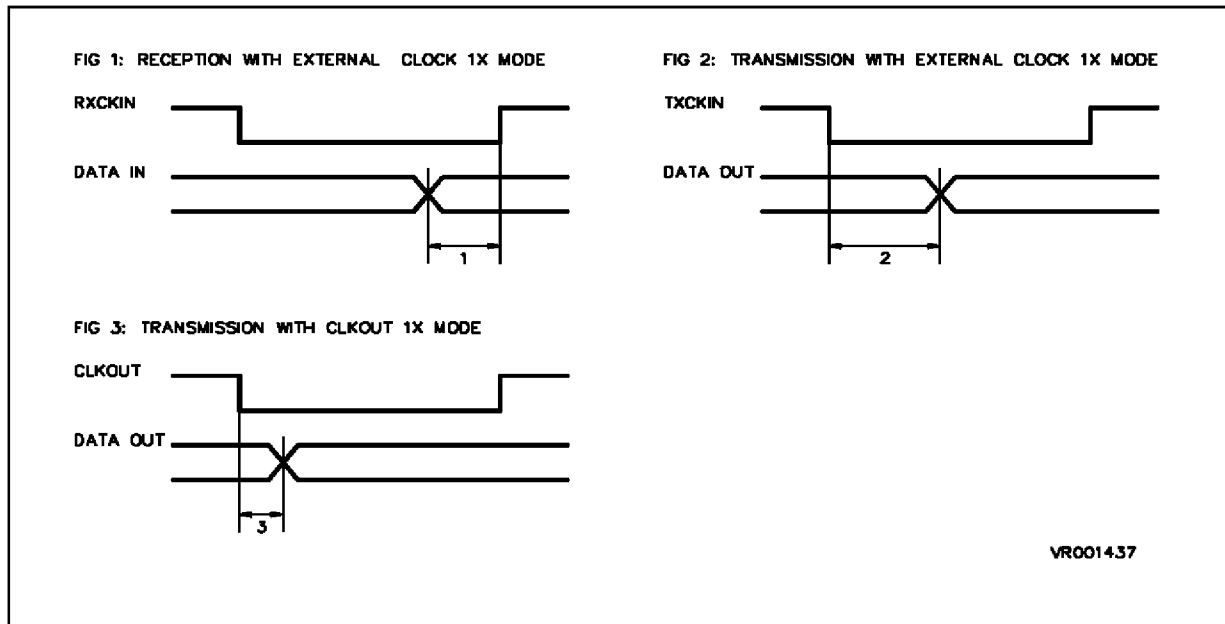

**SCI TIMING TABLE**

**NOTES :**

16K EPROM HCMOS MCU  
WITH EEPROM, RAM AND A/D CONVERTER

- Register oriented 8/16 bit CORE with RUN, WFI and HALT modes
- Minimum instruction cycle time: 500ns (12MHz internal)
- Internal Memory :
 

EPROM	16Kbytes
RAM	256 bytes
EEPROM	512 bytes

 224 general purpose registers available as RAM, accumulators or index pointers (Register File)
- 80-pin Plastic Quad Flat Pack package for ST90T40Q
- 68-lead Plastic Leaded Chip Carrier package for ST90T40C
- 80-pin Windowed Ceramic Quad Flat Pack package for ST90E40G
- 68-lead Windowed Ceramic Leaded Chip Carrier package for ST90E40L
- DMA controller, Interrupt handler and Serial Peripheral Interface as standard features
- 56 fully programmable I/O pins
- Up to 8 external plus 1 non-maskable interrupts
- 16 bit Timer with 8 bit Prescaler, able to be used as a Watchdog Timer
- Two 16 bit Multifunction Timers, each with an 8 bit prescaler and 13 operating modes
- 8 channel 8 bit Analog to Digital Converter, with Analog Watchdogs and external references
- Serial Communications Interface with asynchronous and synchronous capability
- Rich Instruction Set and 14 Addressing modes
- Division-by-Zero trap generation
- Versatile Development tools, including assembler, linker, C-compiler, archiver, graphic oriented debugger and hardware emulators
- Real Time Operating System
- Compatible with ST9036 and ST9040 16K ROM devices

## 1.1 GENERAL DESCRIPTION

The ST90E40 and ST90T40 (following mentioned as ST90E40) are EPROM members of the ST9 family of microcontrollers, in windowed ceramic (E) and plastic OTP (T) packages respectively, completely developed and produced by SGS-THOMSON Microelectronics using a n-well proprietary HCMOS process.

The EPROM parts are fully compatible with their ROM versions and this datasheet will thus provide only information specific to the EPROM based devices.

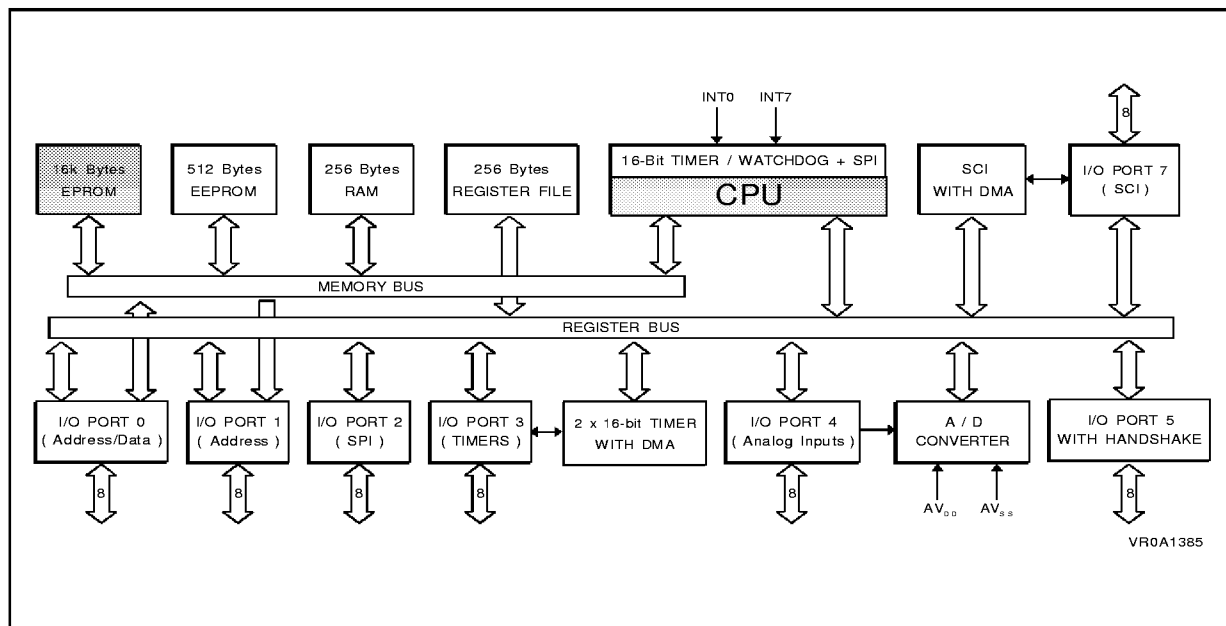

**THE READER IS ASKED TO REFER TO THE DATASHEET OF THE ST9040 ROM-BASED DEVICE FOR FURTHER DETAILS.**

The EPROM ST90E40 may be used for the prototyping and pre-production phases of development, and can be configured as: a standalone microcontroller with 16K bytes of on-chip EPROM, a microcontroller able to manage external memory, or as a parallel processing element in a system with other processors and peripheral controllers.

The nucleus of the ST90E40 is the advanced Core which includes the Central Processing Unit (CPU), the Register File, a 16 bit Timer/Watchdog with 8 bit Prescaler, a Serial Peripheral Interface supporting S-bus, I<sup>2</sup>C-bus and IM-bus Interface, plus two 8 bit I/O ports. The Core has independent memory and register buses allowing a high degree of pipelining to add to the efficiency of the code execution speed of the extensive instruction set.

The powerful I/O capabilities demanded by microcontroller applications are fulfilled by the ST90E40 with up to 56 I/O lines dedicated to digital Input/Output. These lines are grouped into up to seven 8 bit I/O Ports and can be configured on a bit basis under software control to provide timing, status signals, an address/data bus for interfacing external memory, timer inputs and outputs, analog inputs, external interrupts and serial or parallel I/O with or without handshake.

Figure 3. ST90E40 Block Diagram

## GENERAL DESCRIPTION (Continued)

Three basic memory spaces are available to support this wide range of configurations: Program Memory (internal and external), Data Memory (external) and the Register File, which includes the control and status registers of the on-chip peripherals.

Two 16 bit MultiFunction Timers, each with an 8 bit Prescaler and 13 operating modes allow simple use for complex waveform generation and measurement, PWM functions and many other systems timing functions by the usage of the two associated DMA channels for each timer.

## 1.2 PIN DESCRIPTION

**AS.** *Address Strobe (output, active low, 3-state).* Address Strobe is pulsed low once at the beginning of each memory cycle. The rising edge of AS indicates that address, Read/Write (R/W), and Data Memory signals are valid for program or data memory transfers. Under program control, AS can be placed in a high-impedance state along with Port 0 and Port 1, Data Strobe (DS) and R/W.

**DS.** *Data Strobe (output, active low, 3-state).* Data Strobe provides the timing for data movement to or from Port 0 for each memory transfer. During a write cycle, data out is valid at the leading edge of DS. During a read cycle, Data In must be valid prior to the trailing edge of DS. When the ST9040 accesses on-chip memory, DS is held high during the whole memory cycle. It can be placed in a high impedance state along with Port 0, Port 1, AS and R/W.

**R/W.** *Read/Write (output, 3-state).* Read/Write determines the direction of data transfer for external memory transactions. R/W is low when writing to external program or data memory, and high for all other transactions. It can be placed in a high impedance state along with Port 0, Port 1, AS and DS.

**RESET/VPP.** *Reset (input, active low) or VPP (input).* The ST9 is initialised by the Reset signal. With the deactivation of RESET, program execution begins from the Program memory location pointed to by the vector contained in program memory locations 00h and 01h. In the EPROM programming Mode, this pin acts as the programming voltage input VPP.

**INT0, INT7.** *External interrupts (input, active on rising or falling edge).* External interrupt inputs 0 and 7 respectively. INT0 channel may also be used for the timer watchdog interrupt.

In addition there is an 8 channel Analog to Digital Converter with integral sample and hold, fast 11µs conversion time and 8 bit resolution. An Analog Watchdog feature is included for two input channels.

Completing the device is a full duplex Serial Communications Interface with an integral 110 to 375,000 baud rate generator, asynchronous and 1.5Mbyte/s synchronous capability (fully programmable format) and associated address/wake-up option, plus two DMA channels.

**OSCIN, OSCOUT.** *Oscillator (input and output).* These pins connect a parallel-resonant crystal (24MHz maximum), or an external source to the on-chip clock oscillator and buffer. OSCIN is the input of the oscillator inverter and internal clock generator; OSCOUT is the output of the oscillator inverter.

**AVDD.** Analog VDD of the Analog to Digital Converter.

**AVSS.** Analog VSS of the Analog to Digital Converter. *Must be tied to VSS.*

**VDD.** Main Power Supply Voltage (5V ± 10%)

**VSS.** Digital Circuit Ground.

**P0.0-P0.7, P1.0-P1.7, P2.0-P2.7 P3.0-P3.7, P4.0-P4.7, P5.0-P5.7, P7.0-P7.7** *I/O Port Lines (Input/Output, TTL or CMOS compatible).* 56 lines grouped into I/O ports of 8 bits, bit programmable under program control as general purpose I/O or as alternate functions.

### 1.2.1 I/O PORT ALTERNATE FUNCTIONS

Each pin of the I/O ports of the ST90E40/T36 may assume software programmable Alternative Functions as shown in the Pin Configuration Tables. Due to Bonding options for the packages, some functions may not be present, Table 3 shows the Functions allocated to each I/O Port pin and a summary of packages for which they are available.

**PIN DESCRIPTION (Continued)****Table 3. ST90E40, T40 I/O Port Alternate Function Summary**

## 1.1 MEMORY

The memory of the ST90E40 is functionally divided into two areas, the Register File and Memory. The Memory is divided into two spaces, each having a maximum of 65,536 bytes. The two memory spaces are separated by function, one space for Program code, the other for Data. The ST90E40 16K bytes of on-chip EPROM memory are selected at memory addresses 0 through 3FFFh (hexadecimal) in the PROGRAM space, while the ST90T40 OTP version has the top 64 bytes of the EPROM reserved by SGS-THOMSON for testing purposes. The DATA space includes the 512 bytes of on-chip EEPROM at addresses 0 through 1FFh and the 256 bytes of on-chip RAM memory at memory addresses 200h through 2FFh.

**WARNING.** The ST90T40 has its 64 upper bytes in the internal EPROM reserved for testing purpose.

External memory may be addressed using the multiplexed address and data buses (Alternate Functions of Ports 0 and 1). At addresses greater than the first 16K of program space, the ST90E40 executes external memory cycles for instruction fetches. Additional Data Memory may be decoded externally by using the P/D Alternate Function output. The on-chip general purpose (GP) Registers may also be used as RAM memory for minimum chip count systems.

## 1.2 EPROM PROGRAMMING

The 16384 bytes of EPROM memory of the ST90E40 (16320 for the ST90T40) may be programmed by using the EPROM Programming Boards (EPB) available from SGS-THOMSON.

### 1.2.1 Eprom Erasing

The EPROM of the windowed package of the ST90E40 may be erased by exposure to Ultra-Violet light.

The erasure characteristic of the ST90E40 is such that erasure begins when the memory is exposed to light with a wave lengths shorter than approximately 4000Å. It should be noted that sunlight and some types of fluorescent lamps have wave-lengths in the range 3000-4000Å. It is thus recommended that the window of the ST90E40 packages be covered by an opaque label to prevent unintentional erasure problems when testing the application in such an environment.

The recommended erasure procedure of the EPROM is the exposure to short wave ultraviolet light which have a wave-length 2537Å. The integrated dose (i.e. U.V. intensity x exposure time) for erasure should be a minimum of 15W-sec/cm<sup>2</sup>. The erasure time with this dosage is approximately 15 to 20 minutes using an ultraviolet lamp with 12000µW/cm<sup>2</sup> power rating. The ST90E40 should be placed within 2.5cm (1inch) of the lamp tubes during erasure.

Figure 4. Memory Spaces

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	- 0.3 to 7.0	V
$AV_{DD}$ , $AV_{SS}$	Analog Supply Voltage	$V_{SS} = AV_{SS} < AV_{DD} \leq V_{DD}$	V
$V_I$	Input Voltage	- 0.3 to $V_{DD} + 0.3$	V
$V_O$	Output Voltage	- 0.3 to $V_{DD} + 0.3$	V
$V_{PP}$	Input Voltage on $V_{PP}$ Pin	-0.3 to 13.5	V
$T_{STG}$	Storage Temperature	- 55 to + 150	°C
$I_{INJ}$	Pin Injection Current Digital	-5 to 5	mA
$I_{INJ}$	Pin Injection Current Analog	-5 to 5	mA
	Maximum accumulated pin injection Current in the device	-50 to 50	mA

**Note:** Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. All voltages are referenced to  $V_{SS}$

**RECOMMENDED OPERATING CONDITIONS**

Symbol	Parameter	Value		Unit
		Min.	Max.	
$T_A$	Operating Temperature	- 40	85	°C
$V_{DD}$	Operating Supply Voltage	4.5	5.5	V
$f_{OSCE}$	External Oscillator Frequency		24	MHz
$f_{OSCI}$	Internal Clock Frequency (INTCLK)		12	MHz

**DC ELECTRICAL CHARACTERISTICS**

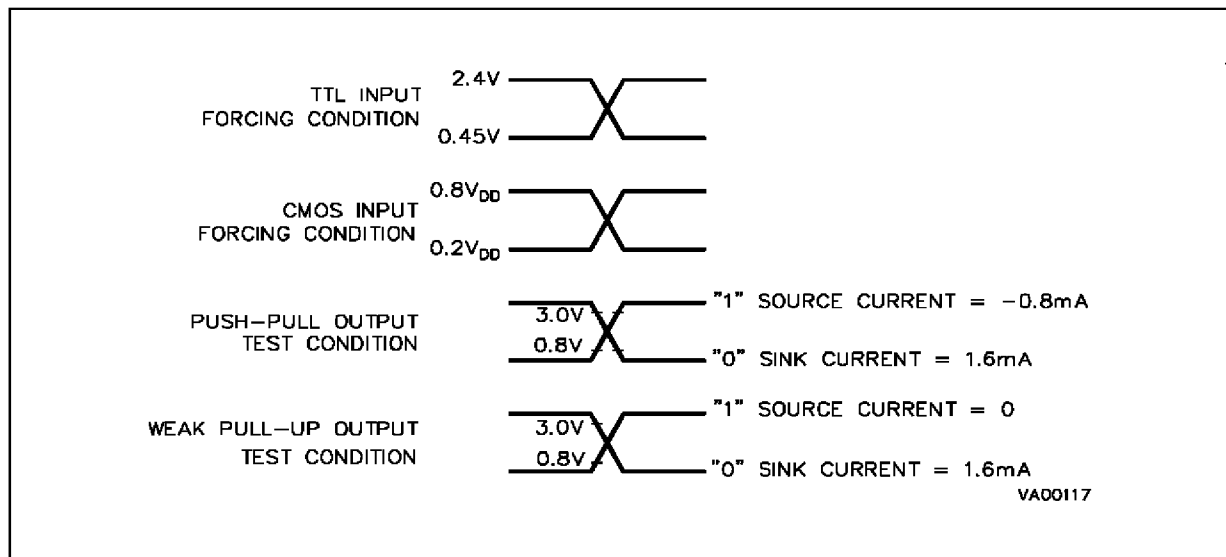

$V_{DD} = 5V \pm 10\%$   $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless otherwise specified)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
$V_{IHCK}$	Clock Input High Level	External Clock	$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{ILCK}$	Clock Input Low Level	External Clock	- 0.3		$0.3 V_{DD}$	V
$V_{IH}$	Input High Level	TTL	2.0		$V_{DD} + 0.3$	V
		CMOS	$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{IL}$	Input Low Level	TTL	- 0.3		0.8	V
		CMOS	- 0.3		$0.3 V_{DD}$	V
$V_{IHRS}$	$\overline{RESET}$ Input High Level		$0.7 V_{DD}$		$V_{DD} + 0.3$	V
$V_{ILRS}$	$\overline{RESET}$ Input Low Level		-0.3		$0.3 V_{DD}$	V
$V_{HYRS}$	$\overline{RESET}$ Input Hysteresis		0.3		1.5	V
$V_{OH}$	Output High Level	Push Pull, $I_{load} = -0.8mA$	$V_{DD} - 0.8$			V
$V_{OL}$	Output Low Level	Push Pull or Open Drain, $I_{load} = 1.6mA$			0.4	V

## DC ELECTRICAL CHARACTERISTICS (continued)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
$I_{WPU}$	Weak Pull-up Current	Bidirectional Weak Pull-up, $V_{OL} = 0V$	- 50	- 200	- 420	$\mu A$
$I_{APU}$	Active Pull-up Current, for INT0 and INT7 only	$V_{IN} < 0.8V$ , under Reset	- 80	- 200	- 420	$\mu A$
$I_{LKIO}$	I/O Pin Input Leakage	Input/Tri-State, $0V < V_{IN} < V_{DD}$	- 10		+ 10	$\mu A$
$I_{LKRS}$	Reset Pin Input Leakage	$0V < V_{IN} < V_{DD}$	- 30		+ 30	$\mu A$
$I_{LKAD}$	A/D Pin Input Leakage	Alternate Function, Open Drain, $0V < V_{IN} < V_{DD}$	- 3		+3	$\mu A$
$I_{LKAP}$	Active Pull-up Input Leakage	$0V < V_{IN} < 0.8V$	- 10		+ 10	$\mu A$
$I_{LKOS}$	OSCIN Pin Input Leakage	$0V < V_{IN} < V_{DD}$	- 10		+ 10	$\mu A$
$V_{PP}$	EPROM Programming Voltage		12.2	12.5	12.8	V
$I_{PP}$	EPROM Programming Current				30	mA

## DC TEST CONDITIONS

**AC ELECTRICAL CHARACTERISTICS**(V<sub>DD</sub> = 5V ± 10% T<sub>A</sub> = - 40°C to + 85°C, unless otherwise specified)

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
I <sub>DD</sub>	Run Mode Current no CPUCLK prescale, Clock divide by 2	24MHz			40	mA
I <sub>DP2</sub>	Run Mode Current Prescale by 2 Clock divide by 2	24MHz			30	mA
I <sub>WFI</sub>	WFI Mode Current no CPUCLK prescale, Clock divide by 2	24MHz			20	mA

**Note** . EPROM parts are tested at 25°C only

**Notes:**

**ROMLESS HCMOS MCU  
WITH EEPROM, RAM AND A/D CONVERTER**

- Register oriented 8/16 bit CORE with RUN, WFI and HALT modes
- Minimum instruction cycle time: 500ns (12MHz internal)
- ROMless to allow maximum external memory flexibility
- Internal Memory :
  - RAM 256 bytes
  - EEPROM 512 bytes224 general purpose registers available as RAM, accumulators or index pointers (register file)
- 68-lead Plastic Leaded Chip Carrier package for ST90R40C
- DMA controller, Interrupt handler and Serial Peripheral Interface as standard features
- 40 fully programmable I/O pins
- Up to 8 external plus 1 non-maskable interrupts
- 16 bit Timer with 8 bit Prescaler, able to be used as a Watchdog Timer
- Two 16 bit Multifunction Timers, each with an 8 bit prescaler and 13 operating modes
- 8 channel 8 bit Analog to Digital Converter, with Analog Watchdogs and external references
- Serial Communications Interface with asynchronous and synchronous capability
- Rich Instruction Set and 14 Addressing modes
- Division-by-Zero trap generation
- Versatile development tools, including assembler, linker, C-compiler, archiver, graphic oriented debugger and hardware emulators
- Real Time Operating System
- Compatible with ST9040 16K ROM device (also available in windowed and One Time Programmable EPROM packages)

## 1.1 GENERAL DESCRIPTION

The ST90R40 is a ROMLESS member of the ST9 family of microcontrollers, completely developed and produced by SGS-THOMSON Microelectronics using a proprietary n-well HCMOS process.

The ROMLESS part may be used for the prototyping and pre-production phases of development, and offers the maximum in program flexibility in production systems.

The ST90R40 is fully compatible with the ST9040 ROM version and this datasheet will thus provide only information specific to the ROMLESS device.

**THE READER IS ASKED TO REFER TO THE DATASHEET OF THE ST9040 ROM-BASED DEVICE.**

The ROMLESS ST90R40 can be configured as a microcontroller able to manage external memory, or as a parallel processing element in a system with other processors and peripheral controllers.

The nucleus of the ST90R40 is the advanced Core which includes the Central Processing Unit (CPU), the Register File, a 16 bit Timer/Watchdog with 8 bit Prescaler, a Serial Peripheral Interface supporting S-BUS, I<sup>2</sup>C-bus and IM-bus Interface, plus two

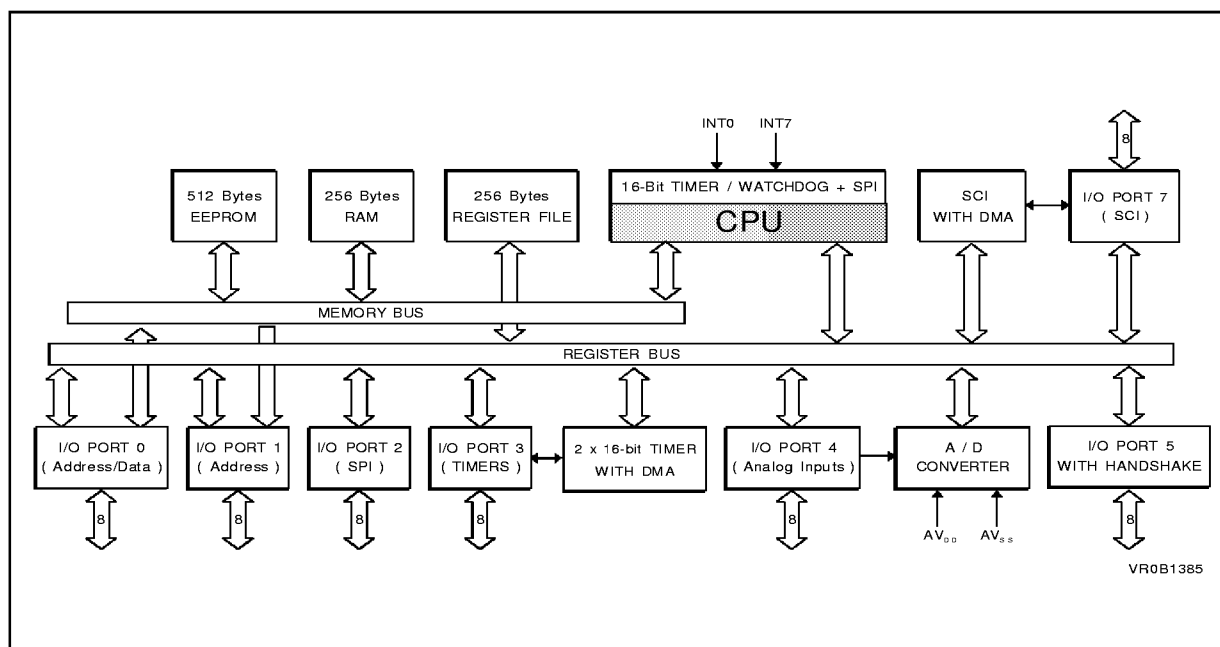

8 bit I/O ports. The Core has independent memory and register buses allowing a high degree of pipelining to add to the efficiency of the code execution speed of the extensive instruction set.

The powerful I/O capabilities demanded by microcontroller applications are fulfilled by the ST90R40 with up to 56 I/O lines dedicated to memory addressing or digital Input/Output. These lines are grouped into up to seven 8 bit I/O Ports and can be configured on a bit basis under software control to provide timing and status signals, address lines, timer inputs and outputs, analog inputs, external interrupts and serial or parallel I/O with or without handshake.

Three memory spaces are available: Program Memory (external), Data Memory (internal and external) and the Register File, which includes the control and status registers of the on-chip peripherals.

Two 16 bit MultiFunction Timers, each with an 8 bit Prescaler and 13 operating modes allow simple use for complex waveform generation and measurement, PWM functions and many other system timing functions by the usage of the two associated DMA channels for each timer.

Figure 2. Block Diagram

**GENERAL DESCRIPTION (Continued)**

In addition there is an 8 channel Analog to Digital Converter with integral sample and hold, fast 11 $\mu$ s conversion time and 8 bit resolution. An Analog Watchdog feature is included for two input channels.

Completing the device is a full duplex Serial Communications Interface with an integral 110 to 375000 baud rate generator, asynchronous and 1.5Mbyte/s synchronous capability (fully programmable format) and associated address/wake-up option, plus two DMA channels.

**1.2 PIN DESCRIPTION**

**AS.** *Address Strobe (output, active low, 3-state).* Address Strobe is pulsed low once at the beginning of each memory cycle. The rising edge of AS indicates that address, Read/Write (R/W), and Data Memory signals are valid for program or data memory transfers. Under program control, AS can be placed in a high-impedance state along with Port 0 and Port 1, Data Strobe (DS) and R/W.

**DS.** *Data Strobe (output, active low, 3-state).* Data Strobe provides the timing for data movement to or from Port 0 for each memory transfer. During a write cycle, data out is valid at the leading edge of DS. During a read cycle, Data In must be valid prior to the trailing edge of DS. When the ST90R40 accesses on-chip Data memory, DS is held high during the whole memory cycle. It can be placed in a high impedance state along with Port 0, Port 1, AS and R/W.

**R/W.** *Read/Write (output, 3-state).* Read/Write determines the direction of data transfer for memory transactions. R/W is low when writing to program or data memory, and high for all other transactions. It can be placed in a high impedance state along with Port 0, Port 1, AS and DS.

**RESET.** *Reset (input, active low).* The ST9 is initialised by the Reset signal. With the deactivation of RESET, program execution begins from the Program memory location pointed to by the vector contained in program memory locations 00h and 01h.

**OSCIN, OSCOUT.** *Oscillator (input and output).* These pins connect a parallel-resonant crystal (24MHz maximum), or an external source to the on-chip clock oscillator and buffer. OSCIN is the input of the oscillator inverter and internal clock generator; OSCOUT is the output of the oscillator inverter.

**AVDD.** Analog VDD of the Analog to Digital Converter.

**AVSS.** Analog VSS of the Analog to Digital Converter. *Must be tied to VSS.*

**VDD.** Main Power Supply Voltage (5V $\pm$ 10%)

**VSS.** Digital Circuit Ground.

**AD0-AD7, (P0.0-P0.7)** *Address/Data Lines (Input/Output, TTL or CMOS compatible).* 8 lines providing a multiplexed address and data bus, under control of the AS and DS timing signals.

**A8-A15** *Address Lines (Output, TTL or CMOS compatible).* 8 lines providing non-multiplexing address bus, under control of the AS and DS timing signals.

**P2.0-P2.7 P3.0-P3.7, P4.0-P4.7, P5.0-P5.7, P7.0-P7.7** *I/O Port Lines (Input/Output, TTL or CMOS compatible).* 40 lines grouped into I/O ports of 8 bits, bit programmable under program control as general purpose I/O or as Alternate functions (see next section).

**1.2.1 I/O PORT ALTERNATE FUNCTIONS**

Each pin of the I/O ports of the ST90R40 may assume software programmable Alternative Functions as shown in the Pin Configuration Drawings. Table 2 shows the Functions allocated to each I/O Port pins.

## PIN DESCRIPTION (Continued)

### 1.3 MEMORY

The memory of the ST90R40 is functionally divided into two areas, the Register File and Memory. The Memory may optionally be divided into two spaces, each having a maximum of 65,536 bytes. The two memory spaces are separated by function, one space for Program code, the other for Data. The ST90R40 addresses all program memory in the external PROGRAM space. The DATA space includes the 512 bytes of on-chip EEPROM at addresses 0 through 1FFh and the 256 bytes of

on-chip RAM memory at addresses 200h through 2FFh.

The External Memory spaces are addressed using the multiplexed address and data buses on Ports 0 and 1. Data Memory may be decoded externally by using the P/D Alternate Function output. The on-chip general purpose (GP) Registers may be used as RAM memory.

Figure 3. Memory Spaces
