

**Multimode 850 nm
1.0625 Gbit/s Fibre Channel
1.3 Gigabit Ethernet 1x9 Transceiver**

V23826-K305-Cxx/Cxxx

Features

- Compliant with Fibre Channel and Gigabit Ethernet standard
- Meets mezzanine standard height of 9.8 mm
- Compact integrated transceiver unit with
 - VCSEL transmitter
 - Integrated receiver
 - Duplex SC receptacle
- Class 1 FDA and IEC laser safety compliant
- FDA Accession No. 9520890-18
- Single power supply (5 V or 3.3 V)
- Signal detect indicator (PECL and TTL version)
- PECL differential inputs and outputs
- Process plug included
- Performance exceeds FC 100-M5-SLI
- Wave solderable and washable with process plug inserted
- For distances of up to 550 m on multimode fiber

Description
Description

The Infineon multimode transceiver is based on the Physical Medium Depend (PMD) sublayer and baseband medium, type 1000-Base-SX (Short Wavelength Laser) (IEEE 802.3z) and complies with the Fibre Channel Physical and Signaling Interface (FC-PH), ANSI X3I TT Fibre Channel Physical Standard Class 100-M5-SLI, latest revision.

The appropriate fiber optic cable is 62.5 μm or 50 μm multimode fiber with Duplex SC connector.

The Infineon multimode transceiver is a single unit comprised of a transmitter, a receiver, and an SC receptacle. This design frees the customer from many alignment and PC board layout concerns.

The module is designed for low cost LAN, WAN, Gigabit Ethernet, and Fibre Channel applications. It can be used as the network end device interface in mainframes, workstations, servers, and storage devices, and in a broad range of network devices such as bridges, routers, intelligent hubs, and local and wide area switches.

This transceiver operates at 1.0625 Gbit/s and 1.3 Gbit/s from a single power supply (5 V or 3.3 V). The full differential data inputs and outputs are PECL compatible.

Link Length as Defined by IEEE and Fibre Channel Standards

62.5 μm , 160 MHz*km	2	220	

¹⁾ Minimum reach as defined by IEEE and Fibre Channel Standards. A 0 m link length (loop-back connector) is supported.

²⁾ Maximum reach as defined by IEEE and Fibre Channel Standards. Longer reach possible depending upon link implementation.

Functional Description

This transceiver is designed to transmit serial data via multimode cable.

Figure 2 Functional Diagram

The receiver component converts the optical serial data into PECL compatible electrical data (RD+ and RD-). The Signal Detect (SD, active high) shows whether an optical signal is present.

The transmitter converts electrical PECL compatible serial data (TD+ and TD-) into optical serial data.

The following versions are available:

- 1 AC/DC transceiver: Tx is AC coupled. Differential 100 Ω load. Rx has standard PECL output and is DC coupled.
- 2 AC/AC TTL transceiver: Tx and Rx are AC coupled. Tx has differential 100 Ω load. Signal Detect is TTL compatible.
- 3 DC/DC transceiver: Standard PECL inputs and outputs Tx and Rx are DC coupled.
- 4 AC/AC PECL transceiver: Tx and Rx are AC coupled. Tx has differential 100 Ω load. Signal Detect is PECL compatible.

Description

The transmitter contains a laser driver circuit that drives the modulation and bias current of the laser diode. The currents are controlled by a power control circuit to guarantee constant output power of the laser over temperature and aging.

The power control uses the output of the monitor PIN diode (mechanically built into the laser coupling unit) as a controlling signal, to prevent the laser power from exceeding the operating limits.

Single fault condition is ensured by means of an integrated automatic shutdown circuit that disables the laser when it detects transmitter failures. A reset is only possible by turning the power off, and then on again.

The transceiver contains a supervisory circuit to control the power supply. This circuit generates an internal reset signal whenever the supply voltage drops below the reset threshold. It keeps the reset signal active for at least 140 milliseconds after the voltage has risen above the reset threshold. During this time the laser is inactive.

¹⁾ Minimum average optical power at which the BER is less than $1 \times 10E-12$ or lower. Measured with a 2^7-1 NRZ PRBS and ER = 9 dB. Output of multimode fiber 65 μm or 50 μm diameter.

²⁾ An increase in optical power above the specified level will cause the Signal Detect output to switch from a low state to a high state.

³⁾ A decrease in optical power below the specified level will cause the Signal Detect to change from a high state to a low state.

⁴⁾ DC/DC, AC/DC for data. DC/DC, AC/DC, AC/AC PECL for SD. PECL compatible. Load is 50 Ω into $V_{CC}-2$ V for data, 500 Ω to V_{EE} for Signal Detect. Measured under DC conditions. For dynamic measurements a tolerance of 50 mV should be added. $V_{CC} = 3.3$ V/5 V. $T_{AMB} = 25^\circ\text{C}$.

⁵⁾ Max. output current
high: -0.4 mA (drive current)
low: +2 mA (sink current).

⁶⁾ AC/AC for data. Load 50 Ω to GND or 100 Ω differential. For dynamic measurement a tolerance of 50 mV should be added.

Eye Safety

This laser based multimode transceiver is a Class 1 product. It complies with IEC 60825-1 and FDA 21 CFR 1040.10 and 1040.11.

To meet laser safety requirements the transceiver shall be operated within the Absolute Maximum Ratings.

Attention: All adjustments have been made at the factory prior to shipment of the devices. No maintenance or alteration to the device is required. Tampering with or modifying the performance of the device will result in voided product warranty.

Note: Failure to adhere to the above restrictions could result in a modification that is considered an act of “manufacturing”, and will require, under law, recertification of the modified product with the U.S. Food and Drug Administration (ref. 21 CFR 1040.10 (i)).

Application Notes

Gigabit transceivers and matching circuits are high frequency components and shall be terminated as recommended in the application notes for proper EMI performance. Electromagnetic emission may be caused by these components.

To prevent emissions it is recommended that cutouts for the fiber connectors be designed as small as possible.

It is strongly recommended that the Tx plug and the Rx plug be separated with a bar that divides the duplex SC opening.

If shielded parts are employed, they should be in proper contact with the bezel (back plane).

Since the shield is galvanically isolated from signal ground it is strongly recommended to prevent any contact between shield and the circuitry i.e. even any ground connection on the pcb may be harmful to EMI performance.

In cases where EMI performance becomes critical it has proven to be helpful when using SC-plugs with less metal parts inside (as Infineon fibers).

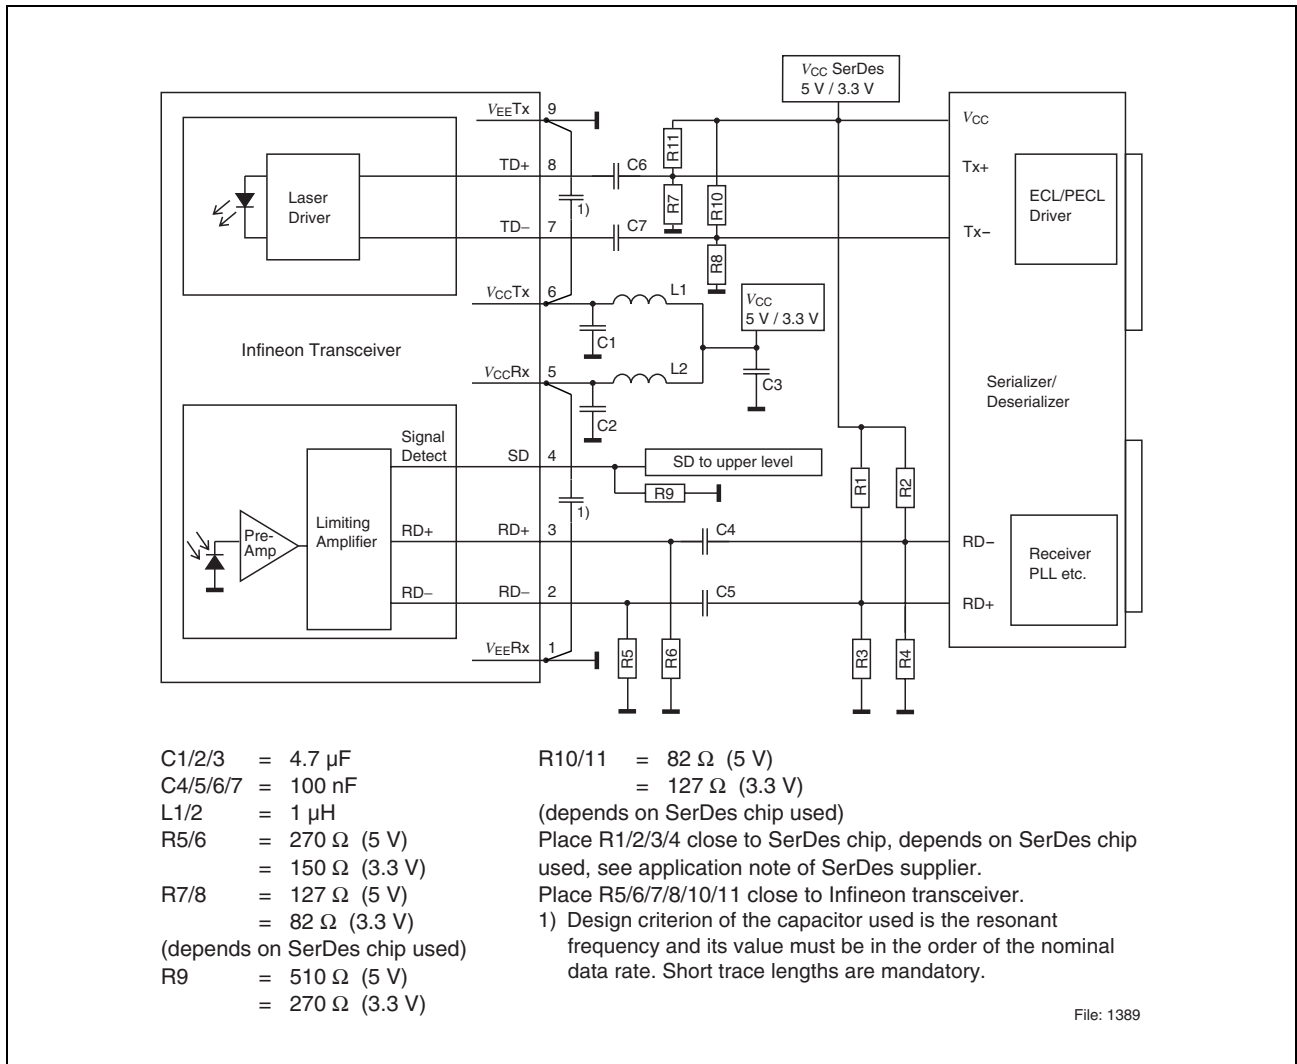

Figure 5

This Application Note assumes Fiber Optic Transceivers using 5 V power supply and SerDes Chips using 3.3 V power supply. It also assumes self biasing at the receiver data inputs (RD+/RD-) of the SerDes chip. Refer to the manufacturer data sheet for other applications. 3.3 V-Transceivers can be directly connected to SerDes-Chips using standard PECL Termination network.

Value of R1 may vary as long as proper 50 Ω termination to V_{EE} or 100 Ω differential is provided. The power supply filtering is required for good EMI performance. Use short tracks from the inductor L1/L2 to the module $V_{CC}Rx/V_{CC}Tx$.

The transceiver contains an automatic shutdown circuit. Reset is only possible if the power is turned off, and then on again. ($V_{CC}Tx$ switched below V_{TH}).
