

ICS552-01A

Crystal Oscillator & Multiplier with 8 Low Skew Outputs

Description

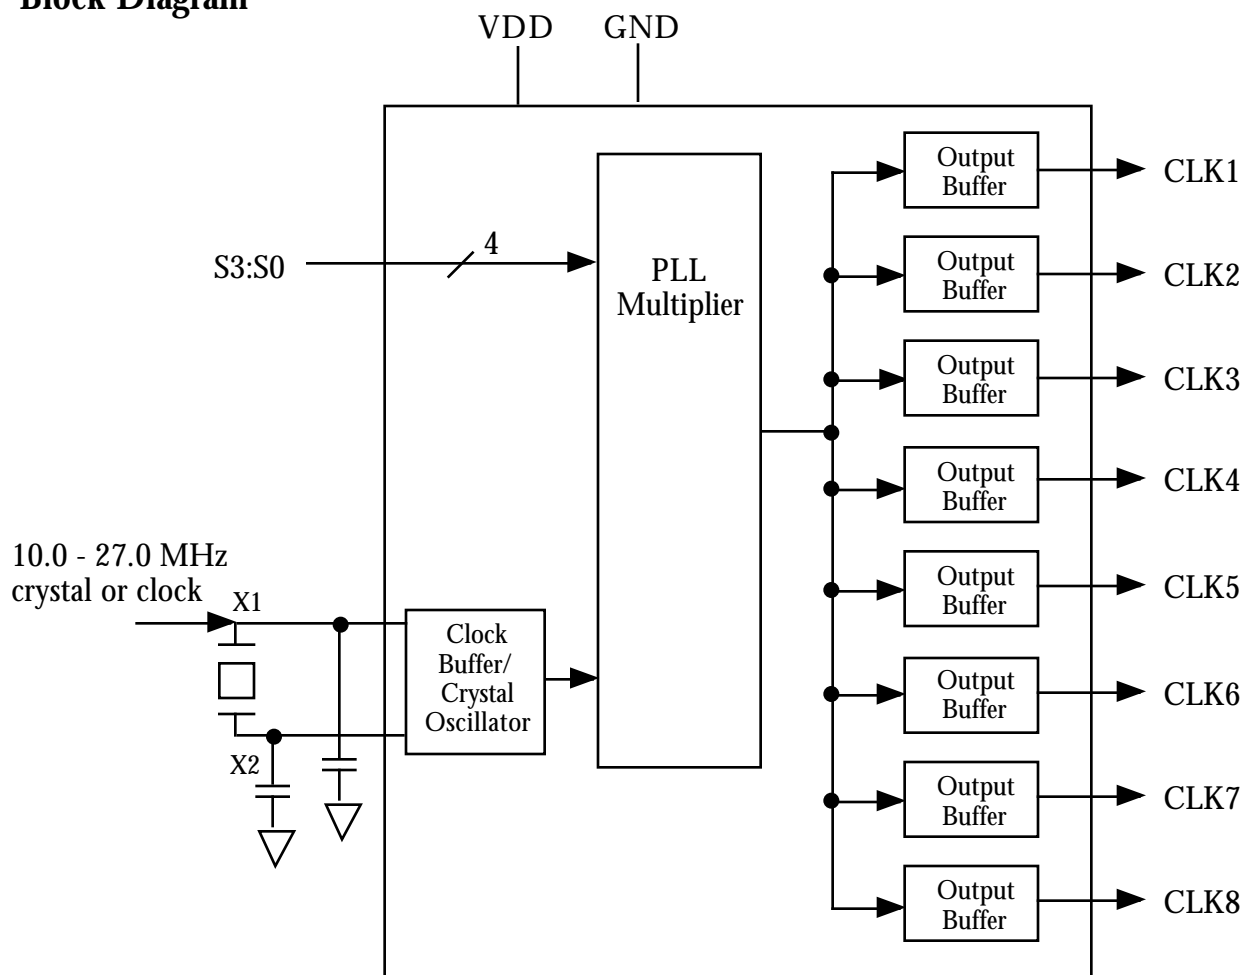

The ICS552-01A produces 8 low skew copies of a multiple of the input when a clock or fundamental, parallel-mode crystal is connected to it. Unlike other clock drivers, it does not require a separate oscillator for the input. Using a phase-locked loop (PLL) to multiply the input frequency, it is ideal for generating and distributing multiple high frequency clocks.

External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01 uF should be connected between VDD and GND on pins 4 and 6, and 16 and 14. Other VDDs and GNDs can be connected to these pins or directly to their respective power planes. A 33 series terminating resistor may be used on the clock output if the trace is longer than 1-inch.

The crystal should be a fundamental mode (do not use third overtone), parallel resonant, with accuracy as required by the application. Crystal capacitors should be connected from pins X1 to ground and X2 to ground. The value of these capacitors is given by the following equation, where C_L is the crystal load capacitance: Crystal caps (pF) = $(C_L - 12) \times 2$. So for a crystal with 18pF load capacitance, two 12pF caps should be used. For a clock input, connect it to X1/ICLK, and leave X2 unconnected (floating).
