HIGH PERFORMANCE ANALOG INTEGRATED CIRCUITS

EL7457C

40MHz Non-Inverting Quad CMOS Driver

Features

- Clocking speeds up to 40MHz
- 4 channels
- 12ns tr/tf at 1000pF C_{LOAD}
- 1ns rise and fall time match
- 1.5ns prop delay match
- Low quiescent current - <1mA
- Fast output enable function - 12ns
- Wide output voltage range
- $8V \geq V_L \geq -5V$
- $-2V \leq V_H \leq 15V$
- 2A peak drive
- 3Ω on resistance
- Input level shifters
- TTL/CMOS input-compatible

Applications

- CCD drivers
- Digital cameras
- Pin drivers
- Clock/line drivers
- Ultrasound transducer drivers
- Ultrasonic and RF generators
- Level shifting

General Description

The EL7457C is a high speed, non-inverting, quad CMOS driver. It is capable of running at clock rates up to 40MHz and features 2A peak drive capability and a nominal on-resistance of just 3Ω. The EL7457C is ideal for driving highly capacitive loads, such as storage and vertical clocks in CCD applications. It is also well suited to ATE pin driving, level-shifting, and clock-driving applications.

The EL7457C is capable of running from single or dual power supplies while using ground referenced inputs. Each output can be switched to either the high (V_H) or low (V_L) supply pins, depending on the related input pin. The inputs are compatible with both 3V and 5V CMOS and TTL logic. The output enable (OE) pin can be used to put the outputs into a high-impedance state. This is especially useful in CCD applications, where the driver should be disabled during power down.

The EL7457C also features very fast rise and fall times which are matched to within 1ns. The propagation delay is also matched between rising and falling edges to within 2ns.

The EL7457C is available in both 16-pin QSOP and 16-pin SO (0.150") packages. It is specified for operation over the full -40°C to +85°C temperature range.

Absolute Maximum Ratings (T_A= 25°C)

Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

Supply Voltage (V_S+ to V_S-)	+16.5V
Input Voltage	V_S- -0.3V, V_S+ +0.3V
Continuous Output Current	100mA
Storage Temperature Range	-65°C to +150°C
Ambient Operating Temperature	-40°C to +85°C
Maximum Die Temperature	+125°C
Power Dissipation	See Curves
Maximum ESD	2kV

Important Note:

All parameters having Min/Max specifications are guaranteed. Typ values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$.

Electrical Characteristics

V_S+ = +5V, V_S- = -5V, V_H = +5V, V_L = -5V, T_A = 25°C, unless otherwise specified.

Parameter	Description	Condition	Min	Typ	Max	Unit
Input						
V_{IH}	Logic "1" Input Voltage		2.0			V
I_{IH}	Logic "1" Input Current	V_{IH} = 5V		0.1	10	µA

Pin Descriptions

Pin	Name	Function	Equivalent Circuit
1	INA	Input channel A	 Circuit 1
2	OE	Output Enable	(Reference Circuit 1)
3	INB	Input channel B	(Reference Circuit 1)
4	VL	Low voltage input pin	
5	GND	Input logic ground	
6	NC	No connection	
7	INC	Input channel C	(Reference Circuit 1)
8	IND	Input channel D	(Reference Circuit 1)
9	VS-	Negative supply voltage	
10	OUTD	Output channel D	 Circuit 2
11	OUTC	Output channel C	(Reference Circuit 2)
12	VH	High voltage input pin	
13	NC	No connection	
14	OUTB	Output channel B	(Reference Circuit 2)
15	OUTA	Output channel A	(Reference Circuit 2)
16	VS+	Positive supply voltage

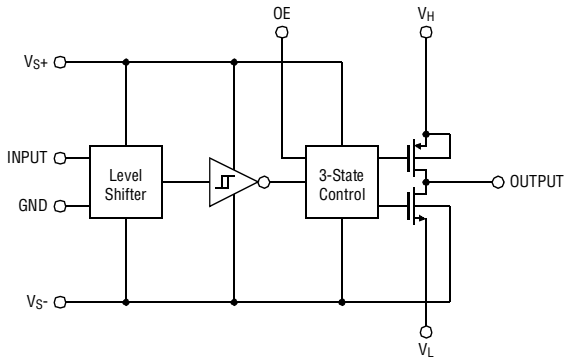
Block Diagram



EL7457C

40MHz Non-Inverting Quad CMOS Driver

Applications Information

Product Description

The EL7457C is a high performance 40MHz high speed quad driver. Each channel of the EL7457C consists of a single P-channel high side driver and a single N-channel low side driver. These 3Ω devices will pull the output (OUT_X) to either the high or low voltage, on V_H and V_L respectively, depending on the input logic signal (IN_X). It should be noted that there is only one set of high and low voltage pins.

A common output enable (OE) pin is available on the EL7457C. This pin, when pulled low will put all outputs in to the high impedance state.

The EL7457C is available in both the 16-pin SO (0.150") and the space saving 16-pin QSOP packages. The relevant package should be chosen depending on the calculated power dissipation.

Supply Voltage Range and Input Compatibility

The EL7457C is designed for operation on supplies from 5V to 15V with 10% tolerance (i.e. 4.5V to 16.5V). The table on page 6 shows the specifications for the relationship between the V_S+, V_S-, V_H, V_L, and GND pins. The EL7457C does not contain a true analog switch and therefore V_L should always be less than V_H.

All input pins are compatible with both 3V and 5V CMOS signals With a positive supply (V_S+) of 5V, the EL7457C is also compatible with TTL inputs.

Power Supply Bypassing

When using the EL7457C, it is very important to use adequate power supply bypassing. The high switching currents developed by the EL7457C necessitate the use of a bypass capacitor on both the positive and negative supplies. It is recommended that a 4.7µF tantalum capacitor be used in parallel with a 0.1µF low-inductance ceramic MLC capacitor. These should be placed as close to the supply pins as possible. It is also recommended that the V_H and V_L pins have some level of bypassing, especially if the EL7457C is driving highly capacitive loads.

Power Dissipation Calculation

When switching at high speeds, or driving heavy loads, the EL7457C drive capability is limited by the rise in die temperature brought about by internal power dissipation. For reliable operation die temperature must be kept below T_{JMAX} (125°C). It is necessary to calculate the power dissipation for a given application prior to selecting package type.

Power dissipation may be calculated:

$$PD = (V_S \times I_S) + \sum_{1}^{4} (C_{INT} \times V_S^2 \times f) + (C_L \times V_{OUT}^2 \times f)$$

where:

V_S is the total power supply to the EL7457C (from V_S+ to V_S-)

V_{OUT} is the swing on the output (V_H - V_L)

C_L is the load capacitance

C_{INT} is the internal load capacitance (80pF max)

I_S is the quiescent supply current (3mA max)

f is frequency

Having obtained the application's power dissipation, the maximum junction temperature can be calculated:

$$T_{JMAX} = T_{MAX} + \Theta_{JA} \times PD$$

where:

T_{JMAX} is the maximum junction temperature (125°C)

T_{MAX} is the maximum ambient operating temperature

PD is the power dissipation calculated above

θ_{JA} is the thermal resistance, junction to ambient, of the application (package + PCB combination). Refer to the Package Power Dissipation curves on page 5
