### Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- High Input Impedance (HA-2600/883) . . . . 100MΩ (Min)  
500MΩ (Typ)
- High Slew Rate . . . . . 4V/μs (Min)  
7V/μs (Typ)
- Low Input Bias Current (HA-2600/883) . . . . 10nA (Max)  
1nA (Typ)
- Low Input Offset Current (HA-2600/883) . . . 4mV (Max)
- Wide Unity Gain Bandwidth . . . . . 12MHz (Typ)
- Output Short Circuit Protection

### Applications

- Video Amplifier
- Pulse Amplifier
- High-Q Active Filters
- High Speed Comparators
- Low Distortion Oscillators

### Description

HA-2600/883 and HA-2602/883 are internally compensated bipolar operational amplifiers that feature very high input impedance coupled with wideband AC performance. The high resistance of the input stage is complemented by low offset voltage (4mV max at +25°C for HA-2600/883) and low bias and offset current (10nA max at +25°C for HA-2600/883) to facilitate accurate signal processing. Offset voltage can be reduced further by means of an external nulling potentiometer. The 4V/μs minimum slew rate at +25°C and the minimum open loop gain of 100kV/V at +25°C enables the HA-2600/883 to perform high gain amplification of fast, wideband signals. These dynamic characteristics, coupled with fast settling times, make these amplifiers ideally suited to pulse amplification designs as well as high frequency or video applications. The frequency response of the amplifier can be tailored to exact design requirements by means of an external bandwidth control capacitor. Other high performance designs such as high gain, low distortion audio amplifiers, high-Q and wideband active filters and high speed comparators, are excellent uses of this part.

**NOTES:**

- Parameters listed in Table 3 are controlled via design or process parameters and are not directly tested at final production. These parameters are lab characterized upon initial design release, or upon design changes. These parameters are guaranteed by characterization based upon data from multiple production runs which reflect lot to lot and within lot variation.
- Full Power Bandwidth guarantee based on Slew Rate measurement using  $FPBW = \text{Slew Rate} / (2\pi V_{PEAK})$ .
- Quiescent Power Consumption based upon Quiescent Supply Current test maximum. (No load on outputs.)
