

March 1997

Features

- Fast Access Time. 70/90ns Max
- Low Standby Current. 50 μ A Max
- Low Operating Current 70mA Max
- Data Retention at 2.0V. 20 μ A Max
- TTL Compatible Inputs and Outputs
- JEDEC Approved Pinout (2716, 6116 Type)
- No Clocks or Strobes Required
- Equal Cycle and Access Time
- Single 5V Supply
- Gated Inputs
- No Pull-Up or Pull-Down Resistors Required

Description

The HM-65162 is a CMOS 2048 x 8 Static Random Access Memory manufactured using the Intersil Advanced SAJI V process. The device utilizes asynchronous circuit design for fast cycle time and ease of use. The pinout is the JEDEC 24 pin DIP, and 32 pad 8-bit wide standard which allows easy memory board layouts flexible to accommodate a variety of industry standard PROMs, RAMs, ROMs and EPROMs. The HM-65162 is ideally suited for use in microprocessor based systems with its 8-bit word length organization. The convenient output enable also simplifies the bus interface by allowing the data outputs to be controlled independent of the chip enable. Gated inputs lower operating current and also eliminate the need for pull-up or pull-down resistors.

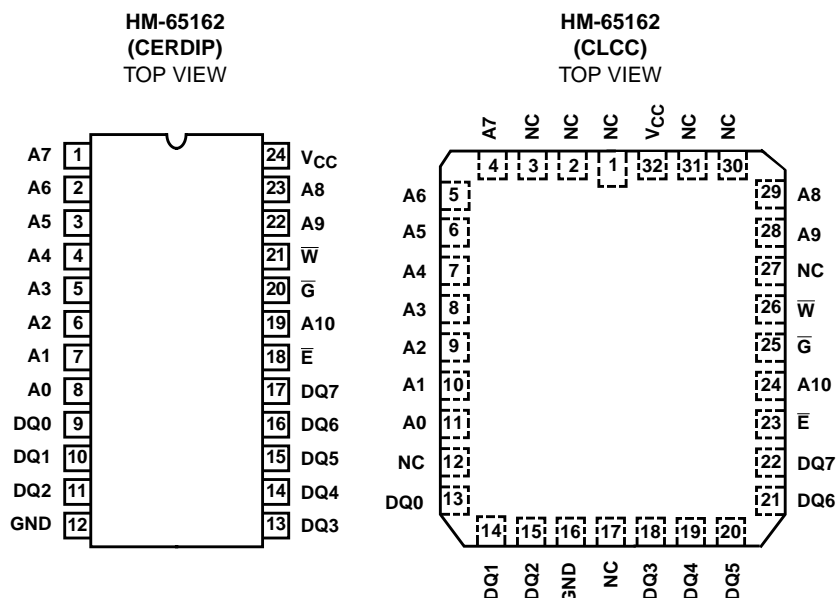

Ordering Information

PACKAGE	TEMP. RANGE	70ns/20 μ A (NOTE 1)	90ns/40 μ A (NOTE 1)	90ns/300 μ A (NOTE 1)	PKG. NO.
CERDIP	-40°C to +85°C	HM1-65162B-9	HM1-65162-9	HM1-65162C-9	F24.6
JAN#	-55°C to +125°C	29110BJA	29104BJA	-	F24.6
SMD#	-55°C to +125°C	8403606JA	8403602JA	8403603JA	F24.6
CLCC	-40°C to +85°C	HM4-65162B-9	HM4-65162-9	HM4-65162C-9	J32.A
SMD#	-55°C to 125°C	8403606ZA	8403602ZA	8403603ZA	J32.A

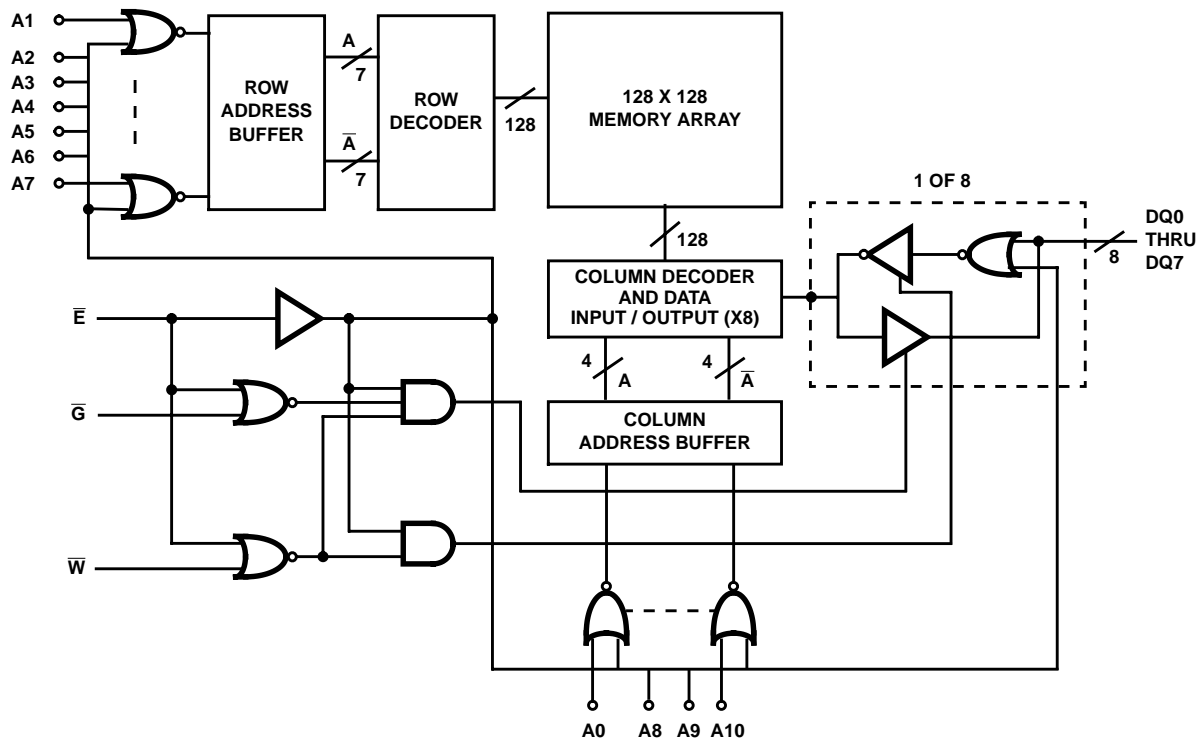

NOTE:

1. Access time/data retention supply current.

Pinouts

PIN	DESCRIPTION
NC	No Connect
A0 - A10	Address Input
\bar{E}	Chip Enable/Power Down
V _{SS} /GND	Ground
DQ0 - DQ7	Data In/Data Out
V _{CC}	Power (+5V)
\bar{W}	Write Enable
\bar{G}	Output Enable

Functional Diagram

HM-65162

Absolute Maximum Ratings

Supply Voltage +7.0V
 Input, Output or I/O Voltage GND -0.3V to $V_{CC} + 0.3V$
 Typical Derating Factor 0.5mA/MHz Increase in ICCOP
 ESD Classification Class 1

Operating Conditions

Operating Voltage Range +4.5V to +5.5V
 Operating Temperature Range
 HM-65162S-9, HM-65162B-9,
 HM-65162-9, HM65162C-9 -40°C to +85°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Thermal Information

Thermal Resistance θ_{JA} (°C/W) θ_{JC} (°C/W)
 CERDIP Package 48 8
 CLCC Package 66 12
 Maximum Storage Temperature Range -65°C to +150°C
 Maximum Junction Temperature +175°C
 Maximum Lead Temperature (Soldering 10s) +300°C

Die Characteristics

Gate Count 26000 Gates

DC Electrical Specifications $V_{CC} = 5V \pm 10\%$; $T_A = -40^\circ C$ to $+85^\circ C$ (HM-65162S-9, HM-65162B-9, HM-65162-9, HM-65162C-9)

SYMBOL	PARAMETER	LIMITS		UNITS	TEST CONDITIONS
		MIN	MAX		
ICCSB1	Standby Supply Current	-	50	μA	HM-65162B-9, IO = 0mA, $\bar{E} = V_{CC} - 0.3V$, $V_{CC} = 5.5V$

(22) TAVWH	Address Valid to End of Write	45	-	50	-	65	-	65	-	ns	(Notes 1, 3)

NOTES:

- Input pulse levels: 0 to 3.0V; Input rise and fall times: 5ns (max); Input and output timing reference level: 1.5V; Output load: 1 TTL gate equivalent and $C_L = 50pF$ (min) - for C_L greater than 50pF, access time is derated by 0.15ns per pF.
- Tested at initial design and after major design changes.
- $V_{CC} = 4.5$ and 5.5V.
- TAVQV = TELQV + TAVEL.

Timing Waveforms

NOTE:

1. \overline{W} is high for a Read Cycle.

FIGURE 1. READ CYCLE

Addresses must remain stable for the duration of the read cycle. To read, \overline{G} and \overline{E} must be $\leq V_{IL}$ and $\overline{W} \geq V_{IH}$. The output buffers can be controlled independently by \overline{G} while \overline{E} is low. To execute consecutive read cycles, \overline{E} may be tied

low continuously until all desired locations are accessed. When \overline{E} is low, addresses must be driven by stable logic levels and must not be in the high impedance state.

NOTE:

1. \overline{G} is low throughout Write Cycle.

FIGURE 2. WRITE CYCLE I

To write, addresses must be stable, \overline{E} low and \overline{W} falling low for a period no shorter than TWLWH. Data in is referenced with the rising edge of \overline{W} , (TDVWH and TWHDX). While addresses are changing, \overline{W} must be high. When \overline{W} falls low, the I/O pins are still in the output state for a period of TWLQZ

and input data of the opposite phase to the outputs must not be applied, (Bus contention). If \overline{E} transitions low simultaneously with the \overline{W} line transitioning low, or after the \overline{W} transition, the output will remain in a high impedance state. \overline{G} is held continuously low.

Timing Waveforms (Continued)

FIGURE 3. WRITE CYCLE II

In this write cycle \overline{G} has control of the output after a period, TGHQZ. \overline{G} switching the output to a high impedance state allows data in to be applied without bus contention after

TGHQZ. When \overline{W} transitions high, the data in can change after TWHDX to complete the write cycle.

Low Voltage Data Retention

Intersil CMOS RAMs are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules ensure data retention:

1. Chip Enable (\overline{E}) must be held high during data retention; within $V_{CC} - 0.3V$ to $V_{CC} + 0.3V$.
2. On RAMs which have selects or output enables (e.g., S, \overline{G}), one of the selects or output enables should be held in the deselected state to keep the RAM outputs high impedance, minimizing power dissipation.
3. Inputs which are to be held high (e.g., \overline{E}) must be kept between $V_{CC} + 0.3V$ and 70% of V_{CC} during the power up and down transitions.
4. The RAM can begin operation > 55ns after V_{CC} reaches the minimum operating voltage (4.5V).
