

Four Independent AC Amplifiers

For Low-Noise and General AC Applications
In Industrial Service

FEATURES

- Four AC amplifiers on a common substrate
 - Independently accessible inputs and outputs
 - Operates from single-ended supply
- EACH AMPLIFIER
- Noise figure at 1kHz 2 dB typ.
 - High voltage gain 53 dB min.

- High input resistance 90 k Ω typ.
- Undistorted output voltage 2 V rms min.
- Output Impedance 1 k Ω typ.
- Open-loop bandwidth 300 kHz typ.

The RCA CA3048 is a silicon monolithic integrated circuit consisting of four independent identical AC amplifiers which can operate from a single-ended power supply.

The amplifiers include internal DC bias and feedback to provide temperature-stabilized operation. They may be used in a wide variety of AC applications in which operational amplifiers have previously been used.

Each high gain amplifier has a high impedance non-inverting input, and a lower impedance inverting input for the application of feedback. Two power-supply terminals and two ground terminals are provided to reduce internal and external coupling between amplifiers.

The CA3048 is supplied in a 16-lead dual-in-line plastic package.

APPLICATIONS

- Multi-channel or cascade operation
- Low-level preamplifiers
- Equalizers
- Linear signal mixers
- Tone generators
- Multivibrators
- AC integrators

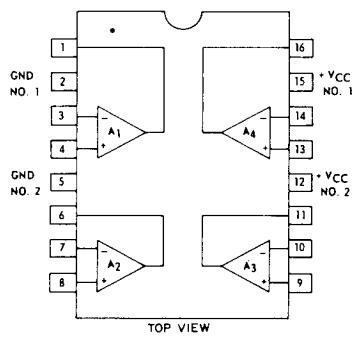

Fig.1 - Block diagram for CA3048.

vs ambient temperature.

To test Amplifiers 1, 2, 3, or 4, connect terminals as shown in Table.

AMPLIFIER	TERMINALS		
	OUTPUT	INPUT	BYPASS
1	1	4	3
2	6	8	7
3	11	9	10
4	16	13	14

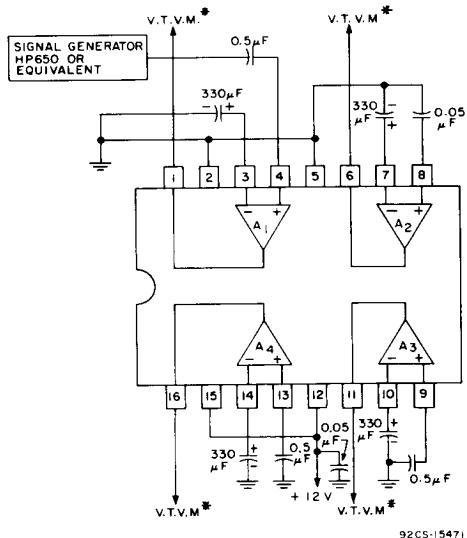

Fig.11 - Test circuit for measurement of broadband noise characteristic.

- $L_1 = 2.5$ millihenry inductor, dc resistance 0.3 ohms or less.
- * Resistors metal film type, 1%. To test amplifiers, connect terminals as shown in Table.

AMPLIFIER	TERMINALS		
	OUTPUT	INPUT	BYPASS
1	1	4	3
2	6	8	7
3	11	9	10
4	16	13	14

Fig.12 - Test circuit for measurement of "weighted" output noise voltage characteristic.

* V.T.V.M. - Hewlett-Packard Model 400D or equivalent.

Procedure:

1. Adjust Signal Generator for 0 dB output at reference terminal.
2. Read voltage at other output terminals (Figure shows terminal #1 used as reference).

OPERATING CONSIDERATIONS

Economical Gain Control

The CA3048 is designed to permit flexibility in the methods by which amplifier gain can be controlled. Fig.14 shows a curve of the gain of an amplifier when the internal resistive feedback of the device is used in conjunction with an external resistor. Although measured gain of various amplifiers will not be uniform, because of tolerances of internal resistances, this method is very economical and easy to apply.

Stability

The CA3048, as in other devices having high gain-bandwidth product, requires some attention to circuit layout, design, and construction to achieve stability.

Should the CA3048 be left unterminated, socket capacitance alone will provide sufficient feedback to cause high frequency oscillations; therefore, all test circuits in this data bulletin include loading networks that provide stability under all conditions.

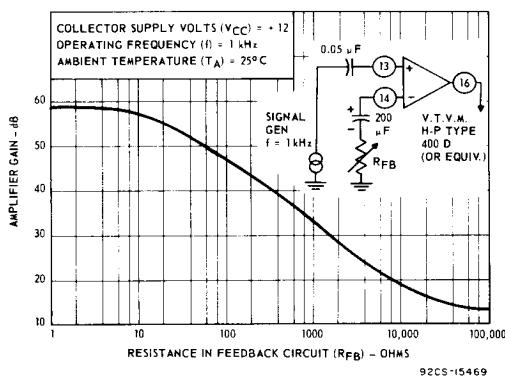

Fig.14 - Typical amplifier gain vs feedback resistance.
