## FEATURES

+3 V, +5 V or $\pm 5$ V Power Supplies
Ultralow Power Dissipation ( $<0.5 \mu \mathrm{~W}$ )
Low Leakage (<100 pA)
Low On Resistance ( $<50 \Omega$ )
Fast Switching Times
Low Charge Injection
Latch-Up Proof
TTL/CMOS Compatible
16-Pin DIP or SOIC Package
APPLICATIONS
Battery Powered Instruments
Single Supply Systems
Remote Powered Equipment
+5 V Supply Systems
Computer Peripherals such as Disk Drives
Precision Instrumentation
Audio and Video Switching
Automatic Test Equipment
Precision Data Acquisition
Sample Hold Systems
Communication Systems
Compatible with $\pm 5$ V Supply DACs and ADCs such as
AD7840/8, AD7870/1/2/4/5/6/8

## GENERAL DESCRIPTION

The ADG511, ADG512 and ADG513 are monolithic CMOS ICs containing four independently selectable analog switches. These switches feature low, well-controlled on resistance and wide analog signal range, making them ideal for precision analog signal switching.
These switch arrays are fabricated using Analog Devices' advanced linear compatible CMOS ( $\mathrm{LC}^{2} \mathrm{MOS}$ ) process which offers the additional benefits of low leakage currents, ultralow power dissipation and low capacitance for fast switching speeds with minimum charge injection. These features make the ADG511, ADG512 and ADG513 the optimum choice for a wide variety of signal switching tasks in precision analog signal processing and data acquisition systems.

The ability to operate from single $+3 \mathrm{~V},+5 \mathrm{~V}$ or $\pm 5 \mathrm{~V}$ bipolar supplies make the ADG511, ADG512 and ADG513 perfect for use in battery-operated instruments, $4-20 \mathrm{~mA}$ loop systems and with the new generation of DACs and ADCs from Analog Devices. The use of 5 V supplies and reduced operating currents give much lower power dissipation than devices operating from $\pm 15 \mathrm{~V}$ supplies.

## REV. 0

[^0]FUNCTIONAL BLOCK DIAGRAM

The ADG511, ADG512 and ADG513 contain four independent SPST switches. The ADG511 and ADG512 differ only in that the digital control logic is inverted. The ADG511 switch is turned on with a logic low on the appropriate control input, while a logic high is required for the ADG512. The ADG513 contains two switches whose digital control logic is similar to that of the ADG511 while the logic is inverted in the remaining two switches.

## PRODUCT HIGHLIGHTS

1. +5 Volt Single Supply Operation

The ADG511/ADG512/ADG513 offers high performance, including low on resistance and wide signal range, fully specified and guaranteed with $+3 \mathrm{~V}, \pm 5 \mathrm{~V}$ as well as +5 V supply rails.
2. Ultralow Power Dissipation CMOS construction ensures ultralow power dissipation.
3. Low $\mathrm{R}_{\mathrm{ON}}$
4. Trench Isolation Guards Against Latch-up A dielectric trench separates the P and N channel transistors thereby preventing latch-up even under severe overvoltage conditions.
5. Break Before Make Switching Switches are guaranteed to have break-before-make operation. This allows multiple outputs to be tied together for multiplexer applications without the possibility of momentary shorting between channels.

NOTES
*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.
${ }^{1}$ Overvoltages at $\mathrm{IN}, \mathrm{S}$ or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG511/ADG512/ADG513 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges.

ORDERING GUIDE

| Model $^{1}$ | Temperature Range ${ }^{2}$ | Package Option |
| :--- | :--- | :--- |
| ADG511BN | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $\mathrm{N}-16$ |
| ADG511BR | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $\mathrm{R}-16 \mathrm{~A}$ |
| ADG511TQ | $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ | $\mathrm{Q}-16$ |

| 1 | ON | OFF |

## TERMINOLOGY

| $\mathrm{V}_{\mathrm{DD}}$ | Most positive power supply potential. |
| :---: | :---: |
| $\mathrm{V}_{\text {SS }}$ | Most negative power supply potential in dual supplies. In single supply applications, it may be connected to GND. |
| GND | Ground ( 0 V ) reference. |
| S | Source terminal. May be an input or output. |
| D | Drain terminal. May be an input or output. |
| IN | Logic control input. |
| $\mathrm{R}_{\text {ON }}$ | Ohmic resistance between D and S. |
| $\mathrm{I}_{\text {S }}(\mathrm{OFF})$ | Source leakage current with the switch "OFF." |
| $\mathrm{I}_{\mathrm{D}}(\mathrm{OFF})$ | Drain leakage current with the switch "OFF." |
| $\mathrm{I}_{\mathrm{D}}, \mathrm{I}_{\mathrm{S}}(\mathrm{ON})$ | Channel leakage current with the switch "ON." |
| $\mathrm{V}_{\mathrm{D}}\left(\mathrm{V}_{\mathrm{S}}\right)$ | Analog voltage on terminals D, S. |
| $\mathrm{C}_{\mathrm{S}}$ (OFF) | "OFF" switch source capacitance. |
| $\mathrm{C}_{\mathrm{D}}$ (OFF) | "OFF" switch drain capacitance. |
| $\mathrm{C}_{\mathrm{D}}, \mathrm{C}_{\mathrm{S}}(\mathrm{ON})$ | "ON" switch capacitance. |
| $\mathrm{t}_{\mathrm{ON}}$ | Delay between applying the digital control input and the output switching on. |
| $\mathrm{t}_{\text {OFF }}$ | Delay between applying the digital control input and the output switching off. |
| $t_{\text {D }}$ | "OFF" or "ON" time measured between the $90 \%$ points of both switches when switching from one address state to another. |
| Crosstalk | A measure of unwanted signal which is coupled through from one channel to another as a result of parasitic capacitance. |
| Off Isolation | A measure of unwanted signal coupling through an "OFF" switch. |
| Charge Injection | A measure of the glitch impulse transferred from the digital input to the analog output during switching. |

## TRENCH ISOLATION

In the ADG511/ADG512/ADG513, an insulating oxide layer (trench) is placed between the NMOS and the PMOS transistors of each CMOS switch. Parasitic junctions, which occur between the transistors in Junction Isolated switches, are eliminated. The result is a completely latch-up proof switch.
In Junction Isolation, the N and P wells of the PMOS and NMOS transistors form a diode which is reverse-biased under normal operation. However, during overvoltage conditions, this diode becomes forward biased. A Silicon-Controlled Rectifier (SCR) type circuit is formed by the two transistors causing a significant amplification of the current which, in turn, leads to latch-up. With Trench Isolation, this diode is removed, the result being a latch-up proof switch.

Trench Isolation also leads to lower leakage currents. The ADG511/ADG512/ADG513 has a leakage current of 0.1 nA as compared with a leakage current of several nanoamps in nonTrench Isolated switches. Leakage current is an important parameter in sample-and-hold circuits, this current being responsible for the discharge of the holding capacitor with time causing droop. The ADG511/ADG512/ADG513's low leakage current, along with its fast switching speeds, make it suitable for fast and accurate sample-and-hold circuits.

## APPLICATION

Figure 10 illustrates a precise sample-and-hold circuit. An AD845 is used as the input buffer while the output operational amplifier is an OP07. During the track mode, SW1 is closed and the output $\mathrm{V}_{\text {OUT }}$ follows the input signal $\mathrm{V}_{\mathrm{IN}}$. In the hold mode, SW1 is opened and the signal is held by the hold capacitor $\mathrm{C}_{\mathrm{H}}$.
Due to switch and capacitor leakage, the voltage on the hold capacitor will decrease with time. The ADG511/ADG512/ADG513 minimizes this droop due to its low leakage specifications. The droop rate is further minimized by the use of a polystyrene hold capacitor. The droop rate for the circuit shown is typically $15 \mu \mathrm{~V} / \mu \mathrm{s}$.
A second switch SW2, which operates in parallel with SW1, is included in this circuit to reduce pedestal error. Since both switches will be at the same potential, they will have a differential effect on the op amp OP07 which will minimize charge injection effects. Pedestal error is also reduced by the compensation network $\mathrm{R}_{\mathrm{C}}$ and $\mathrm{C}_{\mathrm{C}}$. This compensation network also reduces the hold time glitch while optimizing the acquisition time. Using the illustrated op amps and component values, the pedestal error has a maximum value of 5 mV over the $\pm 3 \mathrm{~V}$ input range. The acquisition time is $2.5 \mu \mathrm{~s}$ while the settling time is $1.85 \mu \mathrm{~s}$.
