FUNCTIONAL BLOCK DIAGRAM

Digital controls allow the user to load or read back data from any DAC, load any DAC and transfer data to all DACs at one time.

An active low $\overline{\text { RESET }}$ loads all DAC output registers to midscale for the DAC8412 and zero scale for the DAC8413.

The DAC8412/DAC8413 are available in 28-pin plastic DIP, cerdip, PLCC and LCC packages. They can be operated from a wide variety of supply and reference voltages with supplies ranging from single +5 volt to $\pm 15$ volts, and references from +2.5 to $\pm 10$ volts. Power dissipation is less than 330 mW with $\pm 15$ volt supplies and only 60 mW with a +5 volt supply.
For MIL-STD-883 applications, contact your local ADI sales office for the DAC8412/DAC8413/883 data sheet which specifies operation over the $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ temperature range. All 883 parts are also available on Standard Military Drawings 5962-91-76401MXA through -76404M3A.

## GENERAL DESCRIPTION

The DAC8412 and DAC8413 are quad, 12-bit voltage output DACs with readback capability. Built using a complementary BiCMOS process, these monolithic DACs offer the user very high package density.

Output voltage swing is set by the two reference inputs $V_{\text {REFH }}$ and $\mathrm{V}_{\text {REFL }}$. By setting the $\mathrm{V}_{\text {REFL }}$ input to 0 volts and $\mathrm{V}_{\text {REFH }}$ to a positive voltage, the DAC will provide a unipolar positive output range. A similar configuration with $\mathrm{V}_{\text {REFH }}$ at 0 volts and $\mathrm{V}_{\text {REFL }}$ at a negative voltage will provide a unipolar negative output range. Bipolar outputs are configured by connecting both $\mathrm{V}_{\text {REFH }}$ and $V_{\text {REFL }}$ to nonzero voltages. This method of setting output voltage range has advantages over other bipolar offsetting methods because it is not dependent on internal and external resistors with different temperature coefficients.

## DAC8412/DAC8413-SPECIFICATIONS

## NOTES

${ }^{1}$ All supplies can be varied $\pm 5 \%$, and operation is guaranteed. Device is tested with nominal supplies.
${ }^{2}$ Operation is guaranteed over this reference range, but linearity is neither tested nor guaranteed.
${ }^{3}$ All input control signals are specified with $\mathrm{tr}=\mathrm{tf}=5 \mathrm{~ns}(10 \%$ to $90 \%$ of $+5 \mathrm{~V})$ and timed from a voltage level of 1.6 V .
Specifications subject to change without notice.
( $@ V_{D D}=V_{\text {LOGIC }}=+5.0 \mathrm{~V} \pm 5 \%, \mathrm{~V}_{S S}=0.0 \mathrm{~V}, \mathrm{~V}_{\text {REFH }}=+2.5 \mathrm{~V}, \mathrm{~V}_{\text {REFL }}=0.0 \mathrm{~V}$, and $\mathrm{V}_{S S}=-5.0 \mathrm{~V} \pm 5 \%, \mathrm{~V}_{\text {REFL }}=-2.5 \mathrm{~V},-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ unless otherwise noted.
See Note 1 for supply variations.)

## NOTE

${ }^{*} \theta_{\mathrm{JA}}$ is specified for worst case mounting conditions, i. e., $\theta_{\mathrm{JA}}$ is specified for device in socket.

## CAUTION

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation at or above this specification is not implied. Exposure to the above maximum rating conditions for extended periods may affect device reliability.
2. Digital inputs and outputs are protected, however, permanent damage may occur on unprotected units from high-energy electrostatic fields. Keep units in conductive foam or packaging at all times until ready to use. Use proper antistatic handling procedures.

3. Remove power before inserting or removing units from their sockets.
4. Analog outputs are protected from short circuit to ground or either supply.

## PIN CONFIGURATIONS

LCC

DAC8412/DAC8413 Burn-In Diagram

## OPERATION

## Introduction

The DAC8412 and DAC8413 are quad, voltage output, 12-bit DACs featuring a 12 -bit data bus with readback capability. The only differences between the DAC8412 and DAC8413 are the reset functions. The DAC8412 resets to midscale (code $800_{\mathrm{H}}$ ) and the DAC8413 resets to minimum scale (code $000_{\mathrm{H}}$ ).
The ability to operate from a single +5 volt only supply is a unique feature of these DACs.
dividing the system into three separate functional groups: the digital I/O and logic, the digital to analog converters and the output amplifiers.

## DACs

Each DAC is a voltage switched, high impedance ( $\mathrm{R}=50 \mathrm{k} \Omega$ ), $R-2 R$ ladder configuration. Each $2 R$ resistor is driven by a pair of switches that connect the resistor to either $\mathrm{V}_{\text {REFH }}$ or $\mathrm{V}_{\text {REFL }}$.

## Reference Inputs

All four DACs share common reference high ( $\mathrm{V}_{\text {REFH }}$ ) and reference low ( $\mathrm{V}_{\mathrm{REFL}}$ ) inputs. The voltages applied to these reference inputs set the output high and low voltage limits of all four of the DACs. Each reference input has voltage restrictions with respect to the other reference and to the power supplies. The $\mathrm{V}_{\text {REFL }}$ can be set at any voltage between $\mathrm{V}_{\text {SS }}$ and $\mathrm{V}_{\text {REFH }}-2.5$ volts, and $V_{\text {REFH }}$ can be set to any value between $+V_{D D}-2.5$ volts and $\mathrm{V}_{\mathrm{REFL}}+2.5$ volts. Note that because of these restrictions the DAC8412 references cannot be inverted (i.e., $\mathrm{V}_{\text {REFL }}$ cannot be greater than $\mathrm{V}_{\mathrm{REFH}}$ ).
It is important to note that the DAC8412's $\mathrm{V}_{\text {REFH }}$ input both sinks and sources current. Also the input current of both $\mathrm{V}_{\mathrm{REFH}}$ and $\mathrm{V}_{\text {REFL }}$ are code dependent. Many references have limited current sinking capability and must be buffered with an amplifier to drive $V_{\text {REFH }}$. The $V_{\text {REFL }}$ has no such special requirements.
It is recommended that the reference inputs be bypassed with $0.2 \mu \mathrm{~F}$ capacitors when operating with $\pm 10$ volt references.

## Digital I/O

See Table I for digital control logic truth table. Digital I/O consists of a 12-bit wide bidirectional data bus, two register select inputs, A 0 and A 1 , a R $\overline{\mathrm{W}}$ input, a $\overline{\mathrm{RESET}}$ input, a Chip Select $(\overline{\mathrm{CS}})$, and a Load DAC ( $\overline{\mathrm{LDAC}})$ input. Control of the DACs and bus direction is determined by these inputs as shown in Table I. Digital data bits are labeled with the MSB defined as data bit " 11 " and the LSB as data bit " 0 ." All digital pins are TTL/CMOS compatible.

Table I. DAC8412/DAC8413 Logic Table

| A1 | A0 | R/ $\overline{\mathbf{W}}$ | $\overline{\text { CS }}$ | $\overline{\mathbf{R S}}$ | $\overline{\text { LDAC }}$ | INPUT REG | OUTPUT REG | MODE | DAC |

Figure 1. I/O Logic Diagram
See Figure 1 for a simplified I/O logic diagram. The register select inputs A0 and A1 select individual DAC registers "A" (binary code 00 ) through "D" (binary code 11). Decoding of the registers is enabled by the $\overline{\mathrm{CS}}$ input. When $\overline{\mathrm{CS}}$ is high no decoding takes place, and neither the writing nor the reading of the input registers is enabled. The loading of the second bank of registers is controlled by the $\overline{\mathrm{LDAC}}$ input. By taking $\overline{\mathrm{CS}}$ low while $\overline{\mathrm{CS}}$ is high, all output registers can be updated simultaneously. Note that the $t_{\text {LwD }}$ required pulse width for updating all DACs is a minimum of 170 ns .
The $\mathrm{R} / \overline{\mathrm{W}}$ input, when enabled by $\overline{\mathrm{CS}}$, controls the writing to and reading from the input register.

## Coding

Both the DAC-8412 and DAC8413 use binary coding. The output voltage can be calculated by:

$$
V_{O U T}=V_{R E F L}+\frac{\left(V_{R E F L}-V_{R E F L}\right)^{\star} N}{4096}
$$

where N is the digital code in decimal.

## RESET

The RESET function can be used either at power-up or at any time during the DAC's operation. The RESET function is independent of $\overline{\mathrm{CS}}$. This pin is active LOW and sets the DAC output registers to either center code for the DAC8412, or zero code for the DAC8413. The reset to center code is most useful when the DAC is configured for bipolar references and an output of zero volts after reset is desired.

## Supplies

Supplies required are $\mathrm{V}_{\mathrm{SS}}, \mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\text {LOGIC }}$. The $\mathrm{V}_{\mathrm{SS}}$ supply can be set between -15 volts and 0 volts. $\mathrm{V}_{\mathrm{DD}}$ is the positive supply; its operating range is between +5 and +15 volts.
$V_{\text {LOGIC }}$ is the digital output reference voltage for the readback function. It is normally connected to +5 volts. This pin is a logic reference input only. It does not supply current to the device. If you are not using the readback function, $V_{L O G I C}$ can be hardwired to $V_{D D}$. While $\mathrm{V}_{\text {LOGIC }}$ does not supply current to the DAC8412, it does supply currents to the digital outputs when readback is used.

## Amplifiers

Unlike many voltage output DACs, the DAC8412 features buffered voltage outputs. Each output is capable of both sourcing and sinking 5 mA at $\pm 10$ volts, eliminating the need for external
amplifiers in most applications. These amplifiers are short circuit protected.

Careful attention to grounding is important to accurate operation of the DAC8412. This is not because the DAC8412 is more sensitive than other 12 -bit DACs, but because with four outputs and two references there is greater potential for ground loops. Since the DAC8412 has no analog ground, the ground must be specified with respect to the reference.

## Reference Configurations

Output voltage ranges can be configured as either unipolar or bipolar, and within these choices a wide variety of options exists. The unipolar configuration can be either positive or negative voltage output, and the bipolar configuration can be either symmetrical or nonsymmetrical.

Figure 2. Unipolar +10 V Operation

Figure 3. Symmetrical Bipolar Operation
Figure 3 (Symmetrical Bipolar Operation) shows the DAC8412 configured for $\pm 10$ volt operation. Note: See the AD688 data sheet for a full explanation of reference operation. Adjustments may not be required for many applications since the AD688 is a very high accuracy reference. However if additional adjustments are required, adjust the DAC8412 full scale first. Begin by loading the digital full-scale code $\left(\mathrm{FFF}_{\mathrm{H}}\right)$, and then adjust the Gain Adjust potentiometer to attain a DAC output voltage of 9.9976 volts. Then, adjust the Balance Adjust to set the center scale output voltage to 0.000 volts.
The $0.2 \mu \mathrm{~F}$ bypass capacitors shown at the reference inputs in Figure 3 should be used whenever $\pm 10$ volt references are used. Applications with single references or references to $\pm 5$ volts may not require the $0.2 \mu \mathrm{~F}$ bypassing. The $6.2 \Omega$ resistor in series with the output of the reference amplifier is to keep the amplifier from oscillating with the capacitive load. We have

## DAC8412/DAC8413

found that this is large enough to stabilize this circuit. Larger resistor values are acceptable, provided that the drop across the resistor doesn't exceed a $\mathrm{V}_{\mathrm{BE}}$. Assuming a minimum $\mathrm{V}_{\mathrm{BE}}$ of 0.6 volts and a maximum current of 2.75 mA , then the resistor should be under $200 \Omega$ for the loading of a single DAC8412.

Using two separate references is not recommended. Having two references could cause different drifts with time and temperature; whereas with a single reference, most drifts will track.

Unipolar positive full-scale operation can usually be set with a reference with the correct output voltage. This is preferable to using a reference and dividing down to the required value. For a 10 volt full-scale output, the circuit can be configured as shown in Figure 2. In this configuration the full-scale value is set first by adjusting the $10 \mathrm{k} \Omega$ resistor for a full-scale output of 9.9976 volts.

Figure 4. Unipolar -10 V Operation

Figure 4 shows the DAC8412 configured for -10 volt to zero volt operation. A REF08 with a -10 volt output is connected directly to $\mathrm{V}_{\text {REFL }}$ for the reference voltage.

## Single +5 Volt Supply Operation

For operation with a +5 volt supply, the reference should be set between 1.0 and +2.5 volts for optimum linearity. Note that lower reference voltages will have greater effects due to noise. Figure 5 shows a REF43 used to supply a +2.5 volt reference voltage. The headroom of the reference and DAC are both sufficient to support a +5 volt supply with $\pm 5 \%$ tolerance. $V_{D D}$ and $\mathrm{V}_{\text {LOGIC }}$ should be connected to the same supply and separate bypassing to each pin should be used.

[^0]:    NOTES
    ${ }^{1}$ All supplies can be varied $\pm 5 \%$, and operation is guaranteed. Device is tested with $\mathrm{V}_{\mathrm{DD}}=+4.75 \mathrm{~V}$.
    ${ }^{2}$ For single supply operation only ( $\mathrm{V}_{\text {REFL }}=0.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=0.0 \mathrm{~V}$ ): Due to internal offset errors, INL and DNL are measured beginning at code 2 ( $002_{\mathrm{H}}$ ).
    ${ }^{3}$ Operation is guaranteed over this reference range, but linearity is neither tested nor guaranteed.
    ${ }^{4}$ All input control signals are specified with $\mathrm{tr}=\mathrm{tf}=5 \mathrm{~ns}(10 \%$ to $90 \%$ of $+5 \mathrm{~V})$ and timed from a voltage level of 1.6 V .
    Specifications subject to change without notice.
