

General Purpose CMOS Rail-to-Rail Amplifiers

AD8541/AD8542/AD8544

FEATURES

Single Supply Operation: +2.7 V to +5.5 V
Low Supply Current: 45 μ A/Amplifier
Wide Bandwidth: 1 MHz
No Phase Reversal
Low Input Currents: 4 pA
Unity Gain Stable
Rail-to-Rail Input and Output

APPLICATIONS

ASIC Input or Output Amplifier
Sensor Interface
Piezo Electric Transducer Amplifier
Medical Instrumentation
Mobile Communication
Audio Output
Portable Systems

GENERAL DESCRIPTION

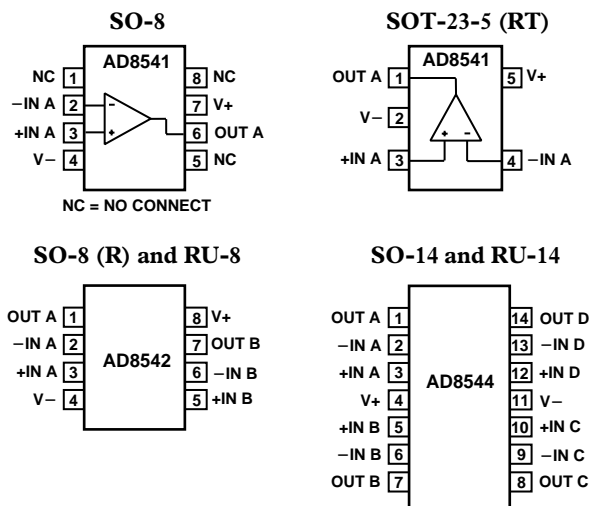

The AD8541/AD8542/AD8544 are single, dual and quad rail-to-rail input and output single supply amplifiers featuring very low supply current and 1 MHz bandwidth. All are guaranteed to operate from a +2.7 V single supply as well as a +5 V supply. These parts provide 1 MHz bandwidth at low current consumption of 45 μ A per amplifier.

Very low input bias currents enable the AD8541/AD8542/AD8544 to be used for integrators, photodiode amplifiers, piezo electric sensors and other applications with high source impedance. Supply current is only 45 μ A per amplifier, ideal for battery operation.

Rail-to-rail inputs and outputs are useful to designers buffering ASICs in single supply systems. The AD8541/AD8542/AD8544 are optimized to maintain high gains at lower supply voltages, making them useful for active filters and gain stages.

The AD8541/AD8542/AD8544 are specified over the extended industrial (-40°C to $+125^{\circ}\text{C}$) temperature range. The AD8541 is available in 8-lead SO and 5-lead SOT-23 packages. The AD8542 is available in 8-lead SO and 8-lead TSSOP surface mount packages. The AD8544 is available in 14-lead narrow SO-14 and 14-lead TSSOP surface mount packages. All TSSOP and SOT versions are available in tape and reel only.

AD8541/AD8542/AD8544

ABSOLUTE MAXIMUM RATINGS¹

Supply Voltage (V_S)	+6 V
Input Voltage	GND to V_S
Differential Input Voltage ²	± 6 V
Storage Temperature Range	
R, RT, RU Packages	-65°C to +150°C
Operating Temperature Range	
AD8541/AD8542/AD8544	-40°C to +125°C
Junction Temperature Range	
R, RT, RU Packages	-65°C to +150°C
Lead Temperature Range (Soldering, 60 sec)	+300°C

NOTES

¹Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

²For supplies less than +6 V, the differential input voltage is equal to $\pm V_S$.

PACKAGE INFORMATION

Package Type	θ_{JA} ¹	θ_{JC}	Units
5-Lead SOT-23 (RT)	256	81	°C/W
8-Lead SOIC (R)	158	43	°C/W
8-Lead TSSOP (RU)	240	43	°C/W
14-Lead SOIC (R)	120	36	°C/W
14-Lead TSSOP (RU)	240	43	°C/W

NOTE

¹ θ_{JA} is specified for worst case conditions, i.e., θ_{JA} is specified for device soldered onto a circuit board for surface mount packages.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD8541/AD8542/AD8544 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

ORDERING GUIDE

Model	Temperature Range	Package Description	Package Option
AD8541AR	-40°C to +125°C	8-Lead SOIC	SO-8
AD8541ART ^{1,2}	-40°C to +125°C	5-Lead SOT-23	RT-5
AD8542AR	-40°C to +125°C	8-Lead SOIC	SO-8
AD8542ARU ³	-40°C to +125°C	8-Lead TSSOP	RU-8
AD8544AR	-40°C to +125°C	14-Lead SOIC	SO-14
AD8544ARU ³	-40°C to +125°C	14-Lead TSSOP	RU-14

NOTES

¹Available in 2,500 piece reels only.

²AD8541ART is marked A4A.

³Available in 3,500 or 10,000 piece reels.

NOTES ON THE AD854x AMPLIFIERS

The AD8541/AD8542/AD8544 amplifiers are improved performance general purpose operational amplifiers. Performance has been improved over previous amplifiers in several ways.

Lower Supply Current for 1 MHz Gain Bandwidth

The AD854x series typically uses 45 microamps of current per amplifier. This is much less than the 200 μ A to 700 μ A used in earlier generation parts with similar performance. This makes the AD854x series a good choice for upgrading portable designs for longer battery life. Alternatively, additional functions and performance can be added at the same current drain.

Higher Output Current

At +5 V single supply, the short circuit current is typically 60 μ A. Even 1 V from the supply rail, the AD854x amplifiers can provide 30 mA, sourcing or sinking.

Sourcing and sinking is strong at lower voltages, with 15 mA available at +2.7 V, and 18 mA at 3.0 V. For even higher output currents, please see the Analog Devices AD8531/AD853/AD8534 parts, with output currents to 250 mA. Information on these parts is available from your Analog Devices representative, and datasheets are available at the Analog Devices website at www.analog.com.

Better Performance at Lower Voltages

The AD854x family parts have been designed to provide better ac performance, at 3.0 V and 2.7 V, than previously available parts. Typical gain-bandwidth product is close to 1 MHz at 2.7 V. Voltage gain at 2.7 V and 3.0 V is typically 500,000. Phase margin is typically over +60°C, making the part easy to use.

APPLICATIONS

Notch Filter

The AD8542 has very high open loop gain (especially with supply voltage below 4 V), which makes it useful for active filters of all types. For example, Figure 31 illustrates the AD8542 in the classic Twin-T Notch Filter design. The Twin-T Notch is desired for simplicity, low output impedance and minimal use of op amps. In fact, this notch filter may be designed with only one op amp if Q adjustment is not required. Simply remove U2 as illustrated in Figure 32. However, a major drawback to this circuit topology is ensuring that all the R's and C's closely match. The components must closely match or notch frequency offset and drift will cause

the circuit to no longer attenuate at the ideal notch frequency. To achieve desired performance, 1% or better component tolerances or special component screens are usually required. One method to desensitize the circuit-to-component mismatch is to increase R2 with respect to R1, which lowers Q. A lower Q increases attenuation over a wider frequency range, but reduces attenuation at the peak notch frequency.

Figure 31. 60 Hz Twin-T Notch Filter, Q = 10

Figure 32. 60 Hz Twin-T Notch Filter, Q = ∞ (Ideal)

Figure 33 diagrams another example of the AD8542 in a notch filter circuit. The FNDNR notch filter has several unique features as compared to the Twin-T Notch including: less critical matching requirements; Q is directly proportional to a single resistor R1. While matching component values is still important, it is also much easier and/or less expensive to

AD8541/AD8542/AD8544

accomplish in the FNDR circuit. For example, the Twin-T Notch uses three capacitors with two unique values, whereas the FNDR circuit uses only two capacitors, which may be of the same value. U3 is simply a buffer that is added to lower the output impedance of the circuit.

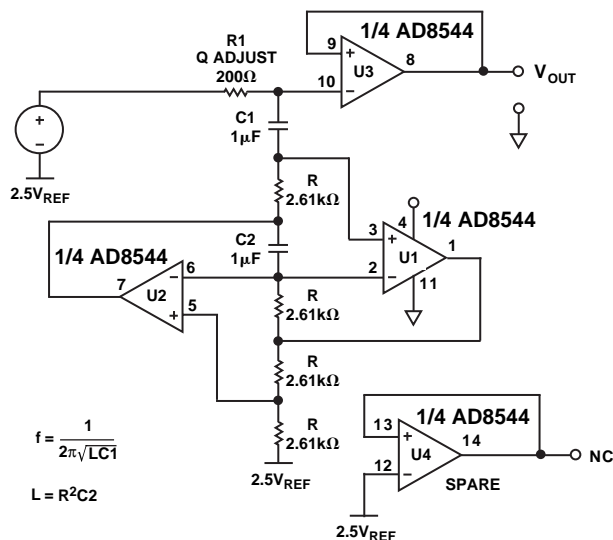

Figure 33. FNDR 60 Hz Notch Filter with Output Buffer

Comparator Function

A comparator function is a common application for a spare op amp in a quad package. Figure 34 illustrates 1/4 of the AD8544 as a comparator in a standard overload detection application. Unlike so many op amps, the AD854x family can double as comparator because this op amp family has rail-to-rail differential input range, rail-to-rail output, and a great speed vs. power ratio. R2 is used to introduce hysteresis. The AD854x when used as comparators have 5 μ s propagation delay @ 5 V and 5 μ s overload recovery time.

Figure 34. The AD854x Comparator Application—Overload Detector

Photodiode Application

The AD854x family has very high impedance with input bias current typically around 4 pA. This characteristic allows the

AD854x op amps to be used in photodiode applications and other applications that require high input impedance. Note that the AD854x has significant voltage offset, which can be removed by capacitive coupling or software calibration.

Figure 35, illustrates a photodiode or current measurement application. The feedback resistor is limited to 10 M Ω to avoid excessive output offset. Also note that a resistor is not needed on the noninverting input to cancel bias current offset, because the bias current related output offset is not significant when compared to the voltage offset contribution. For the best performance follow the standard high impedance layout techniques including: shield circuit, clean circuit board, put a trace connected to the noninverting input around the inverting input, and use separate analog and digital power supplies.

Figure 35. High Input Impedance Application—Photodiode Amplifier
