DESCRIPTION

The M48Z58 ZEROPOWER® RAM is an 8K x 8 non-volatile static RAM that integrates power-fail deselect circuitry and battery control logic on a single die. The monolithic chip is available in two special packages to provide a highly integrated battery backed-up memory solution.

DESCRIPTION (cont'd)

The M48Z58 is a non-volatile pin and function equivalent to any JEDEC standard 8K x 8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special write timing or limitations on the number of writes that can be performed.

The 28 pin 600mil DIP CAPHAT™ houses the M48Z58 silicon with a long life lithium button cell in a single package.

The 28 pin 330mil SO provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT™ housing containing the battery. The unique design allows the SNAPHAT battery package to be mounted on top of the SO package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SO and battery packages are shipped separately in plastic anti-static tubes. The SO package is also available to ship in Tape & Reel form.

DESCRIPTION (cont'd)

For the 28 lead SO, the battery package (i.e. SNAPHAT) part number is "M4Z28-BR00SH1".

The M48Z58 also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single 5V supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low V_{CC}. As V_{CC} falls below approximately 3V, the control circuitry connects the battery which maintains data until valid power returns.

Table 7. Power Down/Up Mode AC Characteristics (T_A = 0 to 70°C)

Symbol	Parameter	Min	Max	Unit

t_R	V_{PFD}(min) to V_{PFD} (max) V_{CC} Rise Time	10		µs
t_{RB}	V_{SO} to V_{PFD} (min) V_{CC} Rise Time	1		µs
t_{REC}	V_{PFD} (max) to Inputs Recognized	40	200	ms

Notes: 1. V_{PFD} (max) to V_{PFD} (min) fall time of less than t_F may result in deselection/write protection not occurring until 200 µs after V_{CC} passes V_{PFD} (min).
2. V_{PFD} (min) to V_{SO} fall time of less than t_{FB} may cause corruption of RAM data.

2. If $\overline{E}$ goes low simultaneously with $\overline{W}$ going low, the outputs remain in the high impedance state.

READ MODE

The M48Z58 is in the Read Mode whenever $\overline{W}$ (Write Enable) is high, $\overline{E}$ (Chip Enable) is low. Thus, the unique address specified by the 13 Address Inputs defines which one of the 8,192 bytes of data is to be accessed. Valid data will be available at the Data I/O pins within t_{AVQV} (Address Access Time) after the last address input signal is stable, providing that the $\overline{E}$ and $\overline{G}$ access times are also satisfied. If the $\overline{E}$ and $\overline{G}$ access times are not met, valid data will be available after the latter of the Chip Enable Access Time (t_{ELQV}) or Output Enable Access Time (t_{GLQV}).

The state of the eight three-state Data I/O signals is controlled by $\overline{E}$ and $\overline{G}$. If the outputs are activated before t_{AVQV}, the data lines will be driven to an indeterminate state until t_{AVQV}. If the Address Inputs are changed while $\overline{E}$ and $\overline{G}$ remain active, output data will remain valid for t_{AXQX} (Output Data Hold Time) but will go indeterminate until the next Address Access.

WRITE MODE

The M48Z58 is in the Write Mode whenever $\overline{W}$ and $\overline{E}$ are low. The start of a write is referenced from the latter occurring falling edge of $\overline{W}$ or $\overline{E}$. A write is terminated by the earlier rising edge of $\overline{W}$ or $\overline{E}$. The addresses must be held valid throughout the cycle. $\overline{E}$ or $\overline{W}$ must return high for minimum of t_{EHAX} from Chip Enable or t_{WHAX} from Write Enable prior to the initiation of another read or write cycle. Data-in must be valid t_{DVWH} prior to the end of write and remain valid for t_{WHDX} afterward. $\overline{G}$ should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on $\overline{E}$ and $\overline{G}$, a low on $\overline{W}$ will disable the outputs t_{WLQZ} after $\overline{W}$ falls.

DATA RETENTION MODE

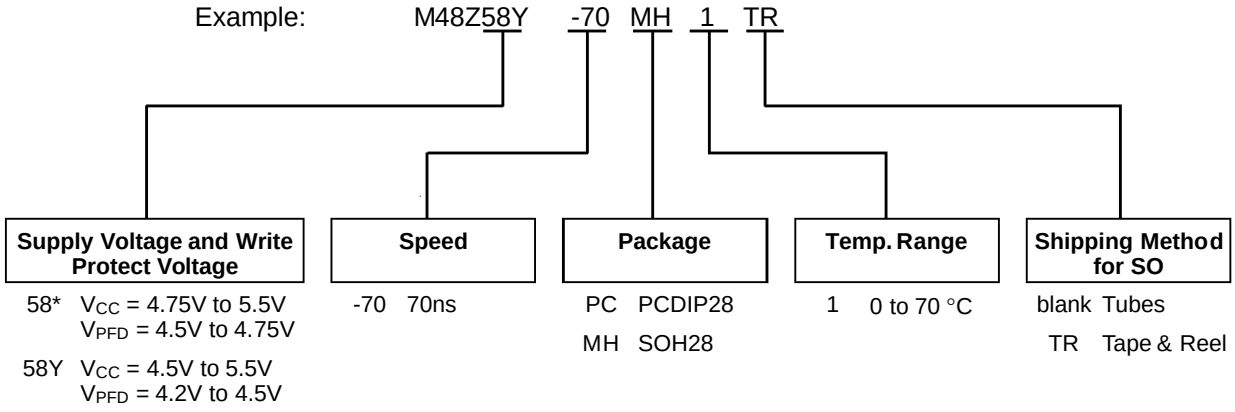
With valid V_{CC} applied, the M48Z58 operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when V_{CC} falls within the V_{PFD}(max), V_{PFD}(min) window. All outputs become high impedance, and all inputs are treated as "don't care."

Note: A power failure during a write cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM's content. At voltages below V_{PFD}(min), the user can be assured the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F. The M48Z58 may respond to transient noise spikes on V_{CC} that reach into the deselect window during the time the device is sampling V_{CC}. Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO}, the control circuit switches power to the internal battery which preserves data. The internal button cell will maintain data in the M48Z58 for an accumulated period of at least 10 years when V_{CC} is less than V_{SO}.

As system power returns and V_{CC} rises above V_{SO}, the battery is disconnected, and the power supply is switched to external V_{CC}. Write protection continues for t_{REC} until V_{CC} reaches V_{PFD}(min). Normal RAM operation can resume t_{REC} after V_{CC} exceeds V_{PFD}(max).

ORDERING INFORMATION SCHEME



Note: 58* CAPHAT package only.

The SO and battery packages are shipped separately in plastic anti-static tubes. The SO package is also available to ship in Tape & Reel form. For the 28 lead SO, the battery package (i.e. SNAPHAT) part number is "M4Z28-BR00SH1".
