Description:

The NHI-1567 series of Mil-Std-1553/1760 monolithic dual transceivers are available in 1.000" x .300" ceramic dual in-line and flatpack packages.

Each receiver converts the 1553 bus bi-phase data to complementary RX and RX_L TTL digital outputs for use by the manchester decoder. The device provides independent receiver enables for each channel.

The transmitters will output bi-phase manchester to the coupling transformer when the TX and TX_L inputs are driven by complementary TTL digital data. The device provides an independent transmitter inhibit TXINH for each channel.

To reduce the pin count and package size, the transmitter outputs are connected to the receiver inputs internal to the device for each channel. This results in only two connections BUS & BUS_L to the coupling transformer per channel.

Transformer Requirements:

The NHI-1567 series requires a transformer with a turns ratio of 1:2.5 for Direct Coupling, and a turns ratio of 1:1.79 for Transformer Coupling to the Mil-Std-1553 Bus. Technitrol part number Q1553-45 or equivalent is recommended. The center tap on the transceiver side of the isolation transformer must be grounded.

Transmit Waveforms

Transmitter Operation:

A high level input on TXINH will inhibit the transmitter outputs. If the TX & TX_L transmitter inputs are both high or both low, the transmitter is also inhibited. The output drivers are short circuit protected and the device will "fold back" to decrease power dissipation under this condition until the fault is removed.

Receive Waveforms

Receiver Operation:

A low level input on RXENA will disable the receiver outputs RX & RX_L regardless of bus activity. The receiver output compatibility may be specified as logic 0 or logic 1 when in standby mode.
