Integrated NPN Digital Transistor with Switching Diode Array

This new option of integrated devices is designed to replace a discrete solution of a single transistor with three switching diodes. BRT (Bias Resistor Transistor) contains a single transistor with a monolithic bias network consisting of two resistors; a series base resistor and a base-emitter resistor. The BRT technology eliminates these individual components by integrating them into a single device, therefore integration of a single BRT with three switching diodes results in a significant reduction of both system cost and board space. This new device is offered in the SC-88 surface mount package.
