

SN74LS195A

Universal 4-Bit Shift Register

The SN74LS195A is a high speed 4-Bit Shift Register offering typical shift frequencies of 39 MHz. It is useful for a wide variety of register and counting applications. It utilizes the Schottky diode clamped process to achieve high speeds and is fully compatible with all ON Semiconductor TTL products.

- Typical Shift Right Frequency of 39 MHz
- Asynchronous Master Reset
- J, \overline{K} Inputs to First Stage
- Fully Synchronous Serial or Parallel Data Transfers
- Input Clamp Diodes Limit High Speed Termination Effects

GUARANTEED OPERATING RANGES

| Symbol | Parameter | Min | Typ | Max | Unit |
|-----------------|-------------------------------------|------|-----|------|------|
| V _{CC} | Supply Voltage | 4.75 | 5.0 | 5.25 | V |
| T _A | Operating Ambient Temperature Range | 0 | 25 | 70 | °C |
| I _{OH} | Output Current – High | | | –0.4 | mA |
| I _{OL} | Output Current – Low | | | 8.0 | mA |

LOGIC DIAGRAM

FUNCTIONAL DESCRIPTION

The Logic Diagram and Truth Table indicate the functional characteristics of the LS195A 4-Bit Shift Register. The device is useful in a wide variety of shifting, counting and storage applications. It performs serial, parallel, serial to parallel, or parallel to serial data transfers at very high speeds.

The LS195A has two primary modes of operation, shift right ($Q_0 \rightarrow Q_1$) and parallel load which are controlled by the state of the Parallel Enable (\overline{PE}) input. When the PE input is HIGH, serial data enters the first flip-flop Q_0 via the J and \overline{K} inputs and is shifted one bit in the direction $Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3$ following each LOW to HIGH clock transition. The \overline{JK} inputs provide the flexibility of the JK type input for special applications, and the simple D type input for general applications by tying the two pins together. When the \overline{PE}

input is LOW, the LS195A appears as four common clocked D flip-flops. The data on the parallel inputs P_0, P_1, P_2, P_3 is transferred to the respective Q_0, Q_1, Q_2, Q_3 outputs following the LOW to HIGH clock transition. Shift left operations ($Q_3 \rightarrow Q_2$) can be achieved by tying the Q_n Outputs to the P_{n-1} inputs and holding the \overline{PE} input LOW.

All serial and parallel data transfers are synchronous, occurring after each LOW to HIGH clock transition. Since the LS195A utilizes edge-triggering, there is no restriction on the activity of the J, \overline{K} , P_n and \overline{PE} inputs for logic operation — except for the set-up and release time requirements.

A LOW on the asynchronous Master Reset (\overline{MR}) input sets all Q outputs LOW, independent of any other input condition.

MODE SELECT — TRUTH TABLE

| OPERATING MODES | INPUTS | | | | | OUTPUTS | | | | |
|---------------------------|-----------------|-----------------|---|----------------|-------|------------------|-------|-------|-------|------------------|
| | \overline{MR} | \overline{PE} | J | \overline{K} | P_n | Q_0 | Q_1 | Q_2 | Q_3 | \overline{Q}_3 |
| Asynchronous Reset | L | X | X | X | X | L | L | L | L | H |
| Shift, Set First Stage | H | h | h | h | X | H | q_0 | q_1 | q_2 | \overline{q}_2 |
| Shift, Reset First | H | h | l | l | X | L | q_0 | q_1 | q_2 | \overline{q}_2 |
| Shift, Toggle First Stage | H | h | h | l | X | \overline{q}_0 | q_0 | q_1 | q_2 | \overline{q}_2 |
| Shift, Retain First Stage | H | h | l | h | X | q_0 | q_0 | q_1 | q_2 | \overline{q}_2 |
| Parallel Load | H | l | X | X | p_n | p_0 | p_1 | p_2 | p_3 | \overline{p}_3 |

L = LOW voltage levels

H = HIGH voltage levels

X = Don't Care

l = LOW voltage level one set-up time prior to the LOW to HIGH clock transition.

h = HIGH voltage level one set-up time prior to the LOW to HIGH clock transition.

p_n (q_n) = Lower case letters indicate the state of the referenced input (or output) one set-up time prior to the LOW to HIGH clock transition.

| t_{PHL} | Propagation Delay, MR to Output | | 19 | 30 | ns | |

AC SETUP REQUIREMENTS ($T_A = 25^\circ\text{C}$)

| Symbol | Parameter | Limits | | | Unit | Test Conditions |
|------------------|----------------------|--------|-----|-----|------|--------------------------|
| | | Min | Typ | Max | | |
| t_W | CP Clock Pulse Width | 16 | | | ns | $V_{CC} = 5.0 \text{ V}$ |
| t_W | MR Pulse Width | 12 | | | ns | |
| t_s | PE Setup Time | 25 | | | ns | |
| t_s | Data Setup Time | 15 | | | ns | |
| t_{rec} | Recovery Time | 25 | | | ns | |
| t_{rel} | PE Release Time | | | 10 | ns | |
| t_h | Data Hold Time | 0 | | | ns | |

DEFINITIONS OF TERMS

SETUP TIME(t_s) —is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) — is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to ensure

continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) — is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order to recognize and transfer HIGH Data to the Q outputs.

AC WAVEFORMS

The shaded areas indicate when the input is permitted to change for predictable output performance.
