

*Designer's™ Data Sheet*  
**SWITCHMODE Series**  
**NPN Silicon Power Transistors**

These transistors are designed for high-voltage, high-speed, power switching in inductive circuits where fall time is critical. They are particularly suited for line-operated switchmode applications. The MJ16012 and MJW16012 are selected high gain versions of the MJ16010 and MJW16010 for applications where drive current is limited.

- Switching Regulators
- Inverters
- Solenoids
- Relay Drivers
- Motor Controls
- Deflection Circuits
- Fast Turn-Off Times —  $T_C = 100^\circ\text{C}$   
50 ns Inductive Fall Time (Typ)  
90 ns Inductive Crossover Time (Typ)  
800 ns Inductive Storage Time (Typ)
- $100^\circ\text{C}$  Performance Specified for:  
Reverse-Biased SOA with Inductive Loads  
Switching Times with Inductive Loads  
Saturation Voltages  
Leakage Currents

**MAXIMUM RATINGS**

Rating	Symbol	MJ16010 MJ16012	MJW16010 MJW16012	Unit

SAFE OPERATING AREA INFORMATION

Figure 15. Maximum Forward Bias Safe Operating Area

$$\beta_f = \frac{I_C}{I_{B1}}$$

FORWARD BIAS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate  $I_C - V_{CE}$  limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 15 is based on  $T_C = 25^\circ\text{C}$ ;  $T_J(\text{pk})$  is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when  $T_C \geq 25^\circ\text{C}$ . Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 15 may be found at any case temperature by using the appropriate curve on Figure 18.

$T_J(\text{pk})$  may be calculated from the data in Figure 17. At high case temperatures, thermal limitations will reduce the

Figure 16. Maximum Reverse Bias Safe Operating Area

power that can be handled to values less than the limitations imposed by second breakdown.

REVERSE BIAS

For inductive loads, high voltage and high current must be sustained simultaneously during turn-off, in most cases, with the base-to-emitter junction reverse biased. Under these conditions the collector voltage must be held to a safe level at or below a specific value of collector current. This can be accomplished by several means such as active clamping, RC snubbing, load line shaping, etc. The safe level for these devices is specified as Reverse Bias Safe Operating Area and represents the voltage current condition allowable during reverse biased turnoff. This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode. Figure 16 gives the RBSOA characteristics.
