

# LP2950

## Micropower Voltage Regulators

The LP2950 and LP2951 are micropower voltage regulators that are specifically designed to maintain proper regulation with an extremely low input-to-output voltage differential. These devices feature a very low quiescent bias current of 75  $\mu\text{A}$  and are capable of supplying output currents in excess of 100 mA. Internal current and thermal limiting protection is provided.

The LP2951 has three additional features. The first is the Error Output that can be used to signal external circuitry of an out of regulation condition, or as a microprocessor power-on reset. The second feature allows the output voltage to be preset to 5.0 V, 3.3 V or 3.0 V output (depending on the version) or programmed from 1.25 V to 29 V. It consists of a pinned out resistor divider along with direct access to the Error Amplifier feedback input. The third feature is a Shutdown input that allows a logic level signal to turn-off or turn-on the regulator output.

Due to the low input-to-output voltage differential and bias current specifications, these devices are ideally suited for battery powered computer, consumer, and industrial equipment where an extension of useful battery life is desirable. The LP2950 is available in the three pin case 29 and DPAK packages, and the LP2951 is available in the eight pin dual-in-line, SO-8 and Micro-8 surface mount packages. The 'A' suffix devices feature an initial output voltage tolerance  $\pm 0.5\%$ .

### LP2950 and LP2951 Features:

- Low Quiescent Bias Current of 75  $\mu\text{A}$
- Low Input-to-Output Voltage Differential of 50 mV at 100  $\mu\text{A}$  and 380 mV at 100 mA
- 5.0 V, 3.3 V or 3.0 V  $\pm 0.5\%$  Allows Use as a Regulator or Reference
- Extremely Tight Line and Load Regulation
- Requires Only a 1.0  $\mu\text{F}$  Output Capacitor for Stability
- Internal Current and Thermal Limiting

### LP2951 Additional Features:

- Error Output Signals an Out of Regulation Condition
- Output Programmable from 1.25 V to 29 V
- Logic Level Shutdown Input

- NOTES:**  
1. Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.  
2.  $V_{O(nom)}$  is the part number voltage option.  
3. Noise tests on the LP2951 are made with a  $0.01\text{ }\mu\text{F}$  capacitor connected across Pins 7 and 1.

## DEFINITIONS

**Dropout Voltage** – The input/output voltage differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 100 mV below its nominal value (which is measured at 1.0 V differential), dropout voltage is affected by junction temperature, load current and minimum input supply requirements.

**Line Regulation** – The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

**Load Regulation** – The change in output voltage for a change in load current at constant chip temperature.

**Maximum Power Dissipation** – The maximum total device dissipation for which the regulator will operate within specifications.

**Bias Current** – Current which is used to operate the regulator chip and is not delivered to the load.

**Output Noise Voltage** – The rms ac voltage at the output, with constant load and no input ripple, measured over a specified frequency range.

**Leakage Current** – Current drawn through a bipolar transistor collector–base junction, under a specified collector voltage, when the transistor is “off”.

**Upper Threshold Voltage** – Voltage applied to the comparator input terminal, below the reference voltage which is applied to the other comparator input terminal, which causes the comparator output to change state from a logic “0” to “1”.

**Lower Threshold Voltage** – Voltage applied to the comparator input terminal, below the reference voltage which is applied to the other comparator input terminal, which causes the comparator output to change state from a logic “1” to “0”.

**Hysteresis** – The difference between Lower Threshold voltage and Upper Threshold voltage.

## APPLICATIONS INFORMATION

### Introduction

The LP2950/LP2951 regulators are designed with internal current limiting and thermal shutdown making them user-friendly. Typical application circuits for the LP2950 and LP2951 are shown in Figures 17 through 25.

These regulators are not internally compensated and thus require a 1.0  $\mu\text{F}$  (or greater) capacitance between the LP2950/LP2951 output terminal and ground for stability. Most types of aluminum, tantalum or multilayer ceramic will perform adequately. Solid tantalums or appropriate multilayer ceramic capacitors are recommended for operation below 25°C.

At lower values of output current, less output capacitance is required for output stability. The capacitor can be reduced to 0.33  $\mu\text{F}$  for currents less than 10 mA, or 0.1  $\mu\text{F}$  for currents below 1.0 mA. Using the 8-pin versions at voltages less than 5.0 V operates the error amplifier at lower values of gain, so that more output capacitance is needed for stability. For the worst case operating condition of a 100 mA load at 1.23 V output (Output Pin 1 connected to the feedback Pin 7) a minimum capacitance of 3.3  $\mu\text{F}$  is recommended.

The LP2950 will remain stable and in regulation when operated with no output load. When setting the output voltage of the LP2951 with external resistors, the resistance values should be chosen to draw a minimum of 1.0  $\mu\text{A}$ .

A bypass capacitor is recommended across the LP2950/LP2951 input to ground if more than 4 inches of wire connects the input to either a battery or power supply filter capacitor.

Input capacitance at the LP2951 Feedback Pin 7 can create a pole, causing instability if high value external resistors are used to set the output voltage. Adding a 100 pF capacitor between the Output Pin 1 and the Feedback Pin 7 and increasing the output filter capacitor to at least 3.3  $\mu\text{F}$  will stabilize the feedback loop.

### Error Detection Comparator

The comparator switches to a positive logic low whenever the LP2951 output voltage falls more than approximately 5.0% out of regulation. This value is the comparator's designed-in offset voltage of 60 mV divided by the 1.235 V internal reference. As shown in the representative block diagram. This trip level remains 5.0% below normal regardless of the value of regulated output voltage. For example, the error flag trip level is 4.75 V for a normal 5.0 V regulated output, or 9.50 V for a 10 V output voltage.

Figure 1 is a timing diagram which shows the  $\overline{\text{ERROR}}$  signal and the regulated output voltage as the input voltage

to the LP2951 is ramped up and down. The  $\overline{\text{ERROR}}$  signal becomes valid (low) at about 1.3 V input. It goes high when the input reaches about 5.0 V ( $V_{\text{out}}$  exceeds about 4.75 V). Since the LP2951's dropout voltage is dependent upon the load current (refer to the curve in the Typical Performance Characteristics), the input voltage trip point will vary with load current. The output voltage trip point does not vary with load.

The error comparator output is an open collector which requires an external pull-up resistor. This resistor may be returned to the output or some other voltage within the system. The resistance value should be chosen to be consistent with the 400  $\mu\text{A}$  sink capability of the error comparator. A value between 100 k and 1.0 M $\Omega$  is suggested. No pull-up resistance is required if this output is unused.

When operated in the shutdown mode, the error comparator output will go high if it has been pulled up to an external supply. To avoid this invalid response, the error comparator output should be pulled up to  $V_{\text{out}}$  (see Figure 15).

Figure 15. ERROR Output Timing

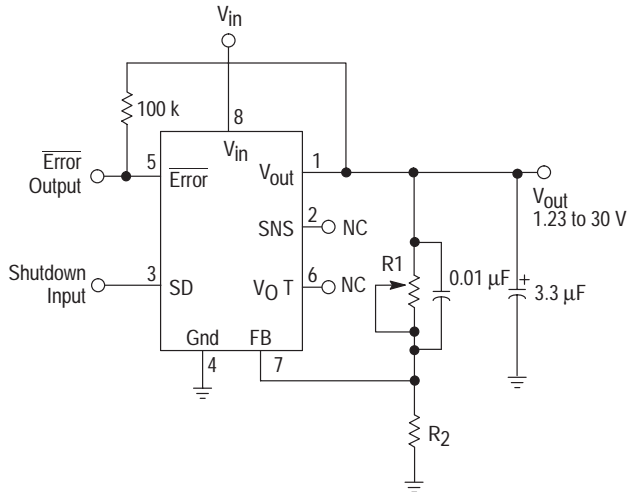

### Programming the Output Voltage (LP2951)

The LP2951CX may be pin-strapped for 5.0 V using its internal voltage divider by tying Pin 1 (output) to Pin 2 (sense) and Pin 7 (feedback) to Pin 6 (5.0 V tap). Alternatively, it may be programmed for any output voltage between its 1.235 reference voltage and its 30 V maximum rating. An external pair of resistors is required, as shown in Figure 16.

**Figure 16. Adjustable Regulator**

The complete equation for the output voltage is:

$$V_{out} = V_{ref} (1 + R1/R2) + I_{FB} R1$$

where  $V_{ref}$  is the nominal 1.235 V reference voltage and  $I_{FB}$  is the feedback pin bias current, nominally  $-20$  nA. The minimum recommended load current of  $1.0$   $\mu$ A forces an upper limit of  $1.2$  M $\Omega$  on the value of  $R2$ , if the regulator must work with no load.  $I_{FB}$  will produce a 2% typical error in  $V_{out}$  which may be eliminated at room temperature by adjusting  $R1$ . For better accuracy, choosing  $R2 = 100$  k reduces this error to 0.17% while increasing the resistor program current to  $12$   $\mu$ A. Since the LP2951 typically draws  $75$   $\mu$ A at no load with Pin 2 open circuited, the extra  $12$   $\mu$ A of current drawn is often a worthwhile tradeoff for eliminating the need to set output voltage in test.

### Output Noise

In many applications it is desirable to reduce the noise present at the output. Reducing the regulator bandwidth by increasing the size of the output capacitor is the only method for reducing noise on the 3 lead LP2950. However, increasing the capacitor from  $1.0$   $\mu$ F to  $220$   $\mu$ F only

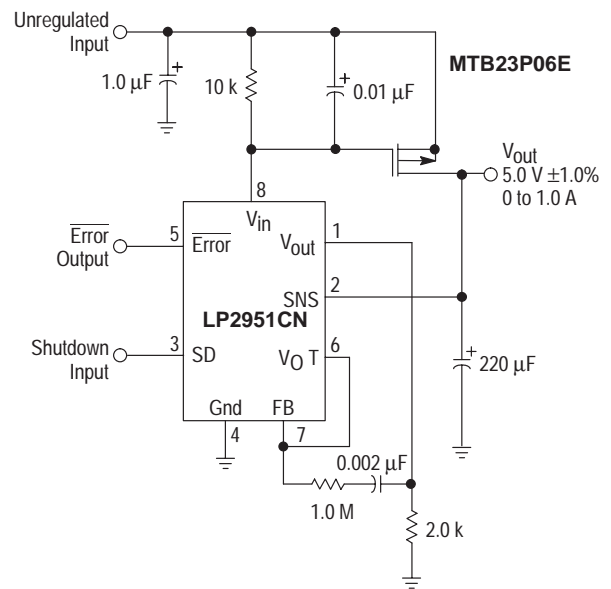

decreases the noise from  $430$   $\mu$ V to  $160$   $\mu$ Vrms for a  $100$  kHz bandwidth at the  $5.0$  V output.

Noise can be reduced fourfold by a bypass capacitor across  $R1$ , since it reduces the high frequency gain from 4 to unity. Pick

$$C_{Bypass} \approx \frac{1}{2\pi R1 \times 200 \text{ Hz}}$$

or about  $0.01$   $\mu$ F. When doing this, the output capacitor must be increased to  $3.3$   $\mu$ F to maintain stability. These changes reduce the output noise from  $430$   $\mu$ V to  $126$   $\mu$ Vrms for a  $100$  kHz bandwidth at  $5.0$  V output. With bypass capacitor added, noise no longer scales with output voltage so that improvements are more dramatic at higher output voltages.

## PACKAGE DIMENSIONS

**Z SUFFIX**  
**(TO-226AA/TO-92)**  
 PLASTIC PACKAGE  
 CASE 29-04  
 ISSUE AD

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: INCH.
3. CONTOUR OF PACKAGE BEYOND DIMENSION R IS UNCONTROLLED.
4. DIMENSION F APPLIES BETWEEN P AND L. DIMENSION D AND J APPLY BETWEEN L AND K. MINIMUM LEAD DIMENSION IS UNCONTROLLED IN P AND BEYOND DIMENSION K MINIMUM.

### D SUFFIX (SO-8) PLASTIC PACKAGE CASE 751-05 ISSUE R

#### NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. DIMENSIONS ARE IN MILLIMETERS.
3. DIMENSION D AND E DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 PER SIDE.
5. DIMENSION B DOES NOT INCLUDE MOLD PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 TOTAL IN EXCESS OF THE B DIMENSION AT MAXIMUM MATERIAL CONDITION.

SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer.

## PUBLICATION ORDERING INFORMATION

### USA/EUROPE Literature Fulfillment:

Literature Distribution Center for ON Semiconductor  
 P.O. Box 5163, Denver, Colorado 80217 USA  
**Phone:** 303-675-2175 or 800-344-3860 Toll Free USA/Canada  
**Fax:** 303-675-2176 or 800-344-3867 Toll Free USA/Canada  
**Email:** ONlit@hibbertco.com

### Fax Response Line\*:

303-675-2167  
 800-344-3810 Toll Free USA/Canada  
 \*To receive a Fax of our publications

**N. America Technical Support:** 800-282-9855 Toll Free USA/Canada

### ASIA/PACIFIC: LDC for ON Semiconductor – Asia Support

**Phone:** 303-675-2121 (Tue-Fri 9:00am to 1:00pm, Hong Kong Time)  
**Email:** ONlit-asia@hibbertco.com

### JAPAN: ON Semiconductor, Japan Customer Focus Center

4-32-1 Nishi-Gotanda, Shinagawa-ku, Tokyo, Japan 141-8549  
**Phone:** 81-3-5487-8345  
**Email:** r14153@onsemi.com
