I²C BUS COMMUNICATIONS, RECEIVE METHOD

Start and stop condition

Bit transfer

Acknowledgement

Data receive format

When data are received, the master transmitter changes to a receiver immediately after the first acknowledgement and the slave receiver changes to a transmitter.

The master always creates the stop condition.

Details are provided in the Philips I²C specifications.

Option data transmit format

In the above method, the subaddresses are automatically incremented from the specified subaddress and data are set.

Purchase of TOSHIBA I²C components conveys license under the Philips I²C patent Rights to use these components in an I²C system, provided that the system conforms to the I²C standard specification as defined by Philips.

Note 1: When testing, see the picture sharpness test circuit diagram. First turn ACB mode off (bus control).

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).
