

SUPPLY VOLTAGE SUPERVISORS

- POWER-ON RESET GENERATOR
- AUTOMATIC RESET GENERATION AFTER VOLTAGE DROP
- WIDE SUPPLY VOLTAGE RANGE ... 3V TO 18V
- PRECISION VOLTAGE SENSOR
- TEMPERATURE-COMPENSATED VOLTAGE REFERENCE
- TRUE AND COMPLEMENT RESET OUTPUTS
- EXTERNALLY ADJUSTABLE PULSE WIDTH

DESCRIPTION

The TL7700A series are monolithic integrated circuit supply voltage supervisors specifically designed for use as reset controllers in microcomputer and microprocessor systems. During power-up the device tests the supply voltage and keeps the RESET and $\overline{\text{RESET}}$ outputs active (high and low, respectively) as long as the supply voltage has not reached its nominal voltage value. Taking RESIN low has the same effect. To ensure that the microcomputer system has reset, the TL7700A then initiates an internal time delay that delays the return of the reset outputs to their inactive states. Since the time delay for most microcomputers and microprocessors is in the order of several machine cycles, the device internal time delay is determined by an external time delay is determined by an external capacitor connected to the C_T input (pin 3).

$$t_d = 1.3 \times 10^4 \times C_T$$

Where : C_T is in farads (F) and t_d in seconds (s). In addition, when the supply voltage drops below the nominal value, the outputs will be active until the supply voltage returns to the nominal value. An external capacitor (typically 0.1 μF) must be connected to the REF output (pin 1) to reduce the influence of fast transients in the supply voltage.

The TL7700AI series is characterized for operation from -25°C to 85°C ; the TL7700AC series is characterized from 0°C to 70°C .
