4554 Group

SINGLE-CHIP 4-BIT CMOS MICROCOMPUTER

REJ03B0043-0300Z
Rev.3.00
Aug 06, 2004

DESCRIPTION

The 4554 Group is a 4-bit single-chip microcomputer designed with CMOS technology. Its CPU is that of the 4500 series using a simple, high-speed instruction set. The computer is equipped with main clock selection function, four 8-bit timers (each timer has one or two reload registers), interrupts, and LCD control circuit.
The various microcomputers in the 4554 Group include variations of the built-in memory size as shown in the table below.

FEATURES

- Minimum instruction execution time ..... 0.5 μs
  (at 6 MHz oscillation frequency, in high-speed through-mode)
- Supply voltage
  Mask ROM version ..... 2.0 to 5.5 V
  One Time PROM version ..... 2.5 to 5.5 V
  (It depends on oscillation frequency and operation mode)
- Timers
  Timer 1 ..... 8-bit timer with a reload register
  Timer 2 ..... 8-bit timer with a reload register
  Timer 3 ..... 8-bit timer with a reload register
  Timer 4 ..... 8-bit timer with two reload registers
  Timer 5 ..... 16-bit timer (fixed dividing frequency)
- Interrupt ..... 7 sources
- Key-on wakeup function pins 10
- LCD control circuit
  Segment output 32
  Common output 4
- Voltage drop detection circuit (Reset) ..... Typ. 1.5 V
- Watchdog timer
- Clock generating circuit
  Main clock
  (ceramic resonator/RC oscillation/on-chip oscillator)
  Sub-clock
  (quartz-crystal oscillation)
- LED drive directly enabled (port D)

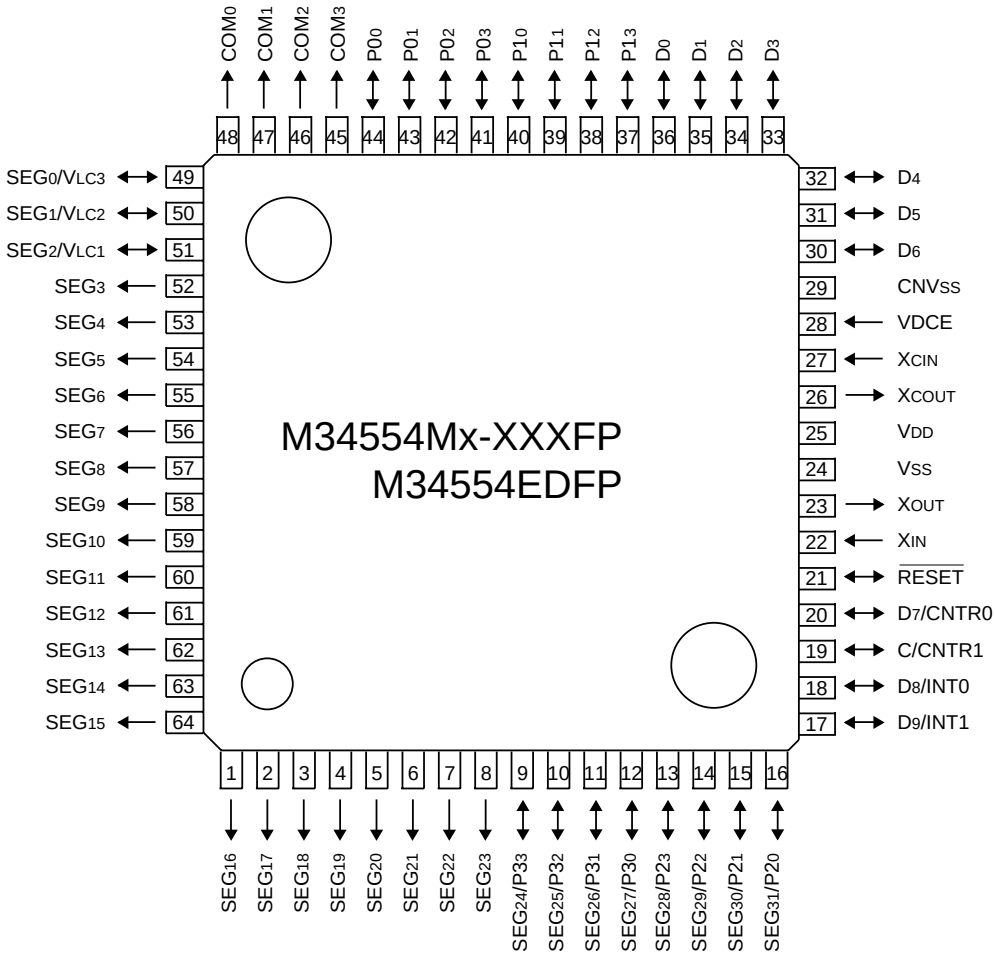
APPLICATION

Remot control transmitter

Part number	ROM (PROM) size (× 10 bits)	RAM size (× 4 bits)	Package	ROM type
M34554M8-XXXFP	8192 words	512 words	64P6N-A	Mask ROM
M34554MC-XXXFP	12288 words	512 words	64P6N-A	Mask ROM
M34554EDFP (**Note**)	16384 words	512 words	64P6N-A	One Time PROM

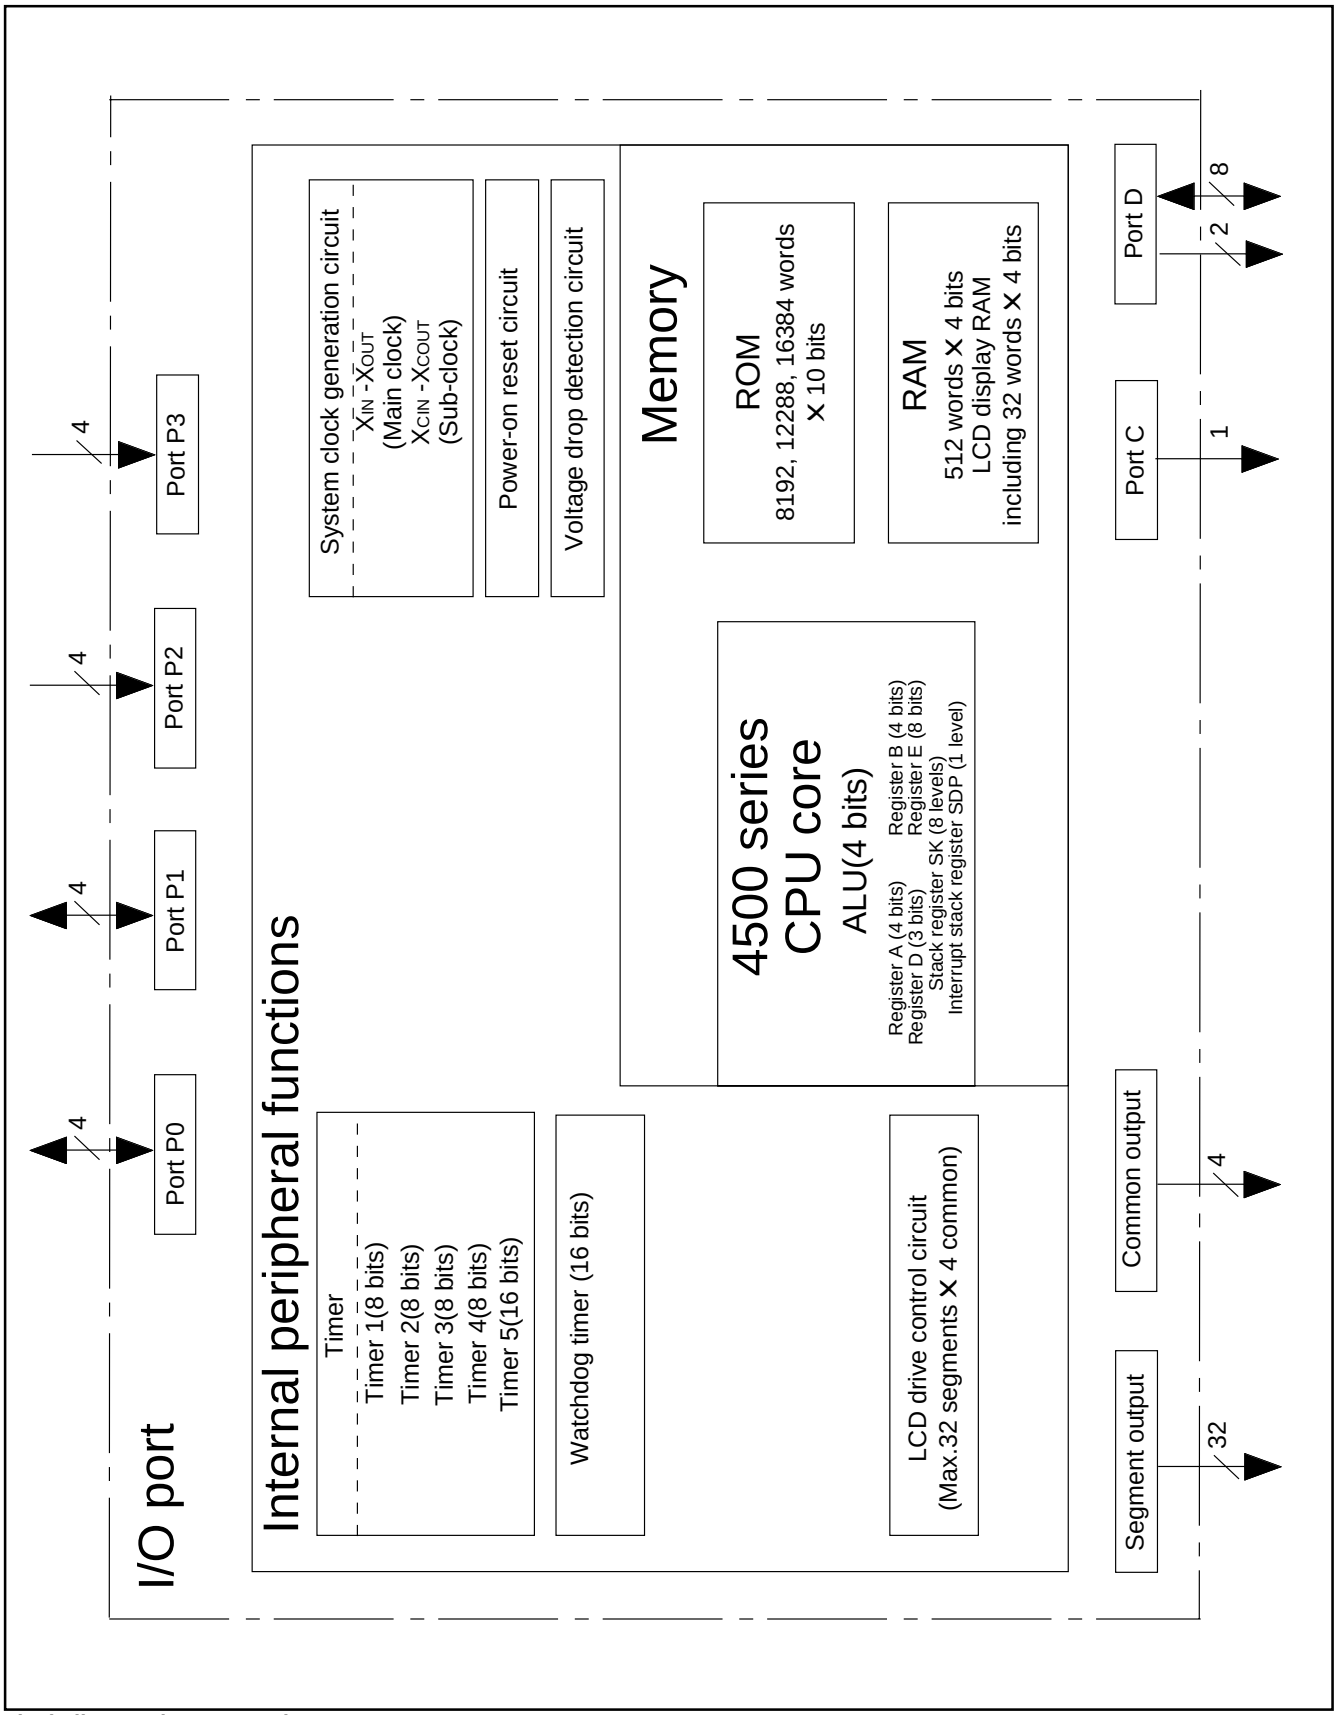
Note: Shipped in blank.

PIN CONFIGURATION



OUTLINE 64P6N-A

Pin configuration (top view) (4554 Group)



Block diagram (4554 Group)

PERFORMANCE OVERVIEW

Parameter			Function
Number of basic instructions			136
Minimum instruction execution time			0.5 μs (at 6 MHz oscillation frequency, in high-speed through mode)
Memory sizes	ROM	M34554M8	8192 words × 10 bits
		M34554MC	12288 words × 10 bits
		M34554ED	16384 words × 10 bits
	RAM		512 words × 4 bits (including LCD display RAM 32 words × 4 bits)
Input/Output ports	D_0–D_7	I/O	Eight independent I/O ports. Input is examined by skip decision. The output structure can be switched by software. Port D_7 is also used as CNTR0 pin.
	D_8, D_9	Output	Two independent output ports. Ports D_8 and D_9 are also used as INT0 and INT1, respectively.
	$P0_0$–$P0_3$	I/O	4-bit I/O port; A pull-up function, a key-on wakeup function and output structure can be switched by software.
	$P1_0$–$P1_3$	I/O	4-bit I/O port; A pull-up function, a key-on wakeup function and output structure can be switched by software.
	$P2_0$–$P2_3$	Input	4-bit input port; Port $P2_0$–$P2_3$ are also used as SEG_{31}–SEG_{28} pins.
	$P3_0$–$P3_3$	Input	4-bit input port; Port $P3_0$–$P3_3$ are also used as SEG_{27}–SEG_{24} pins.
	C	Output	1-bit output; Port C is also used as CNTR1 pin.
Timers	Timer 1		8-bit programmable timer with a reload register and has an event counter.
	Timer 2		8-bit programmable timer with a reload register.
	Timer 3		8-bit programmable timer with a reload register and has an event counter.
	Timer 4		8-bit programmable timer with two reload registers.
	Timer 5		16-bit timer, fixed dividing frequency
LCD control circuit	Selective bias value		1/2, 1/3 bias
	Selective duty value		2, 3, 4 duty
	Common output		4
	Segment output		32
	Internal resistor for power supply		2r × 3, 2r × 2, r × 3, r × 2 (they can be switched by software.)
Interrupt	Sources		7 (two for external, five for timer)
	Nesting		1 level
Subroutine nesting			8 levels
Device structure			CMOS silicon gate
Package			64-pin plastic molded QFP (64P6N)
Operating temperature range			–20 °C to 85 °C
Supply voltage	Mask ROM version		2 to 5.5 V (It depends on the operation source clock, operation mode and oscillation frequency.)
	One Time PROM version		2.5 to 5.5 V (It depends on the operation source clock, operation mode and oscillation frequency.)
Power dissipation	Active mode		2.8 mA (Ta=25°C, V_{DD} = 5 V, f(X_{IN}) = 6 MHz, f(X_{CIN}) = 32 kHz, f(STCK) = f(X_{IN}))
	Clock operating mode		20 μA (Ta=25°C, V_{DD} = 5 V, f(X_{CIN}) = 32 kHz)
	At RAM back-up		0.1 μA (Ta=25°C, V_{DD} = 5 V)

PIN DESCRIPTION

Pin	Name	Input/Output	Function
V_{DD}	Power supply	—	Connected to a plus power supply.
V_{SS}	Ground	—	Connected to a 0 V power supply.
CNV_{SS}	CNV_{SS}	—	Connect CNV_{SS} to V_{SS} and apply “L” (0V) to CNV_{SS} certainly.
VDCE	Voltage drop detection circuit enable	Input	This pin is used to operate/stop the voltage drop detection circuit. When “H“ level is input to this pin, the circuit starts operating. When “L“ level is input to this pin, the circuit stops operating.
$\overline{RESET}$	Reset input/output	I/O	An N-channel open-drain I/O pin for a system reset. When the watchdog timer, the built-in power-on reset or the voltage drop detection circuit causes the system to be reset, the $\overline{RESET}$ pin outputs “L” level.
X_{IN}	Main clock input	Input	I/O pins of the main clock generating circuit. When using a ceramic resonator, connect it between pins X_{IN} and X_{OUT}. A feedback resistor is built-in between them. When using the RC oscillation, connect a resistor and a capacitor to X_{IN}, and leave X_{OUT} pin open.
X_{OUT}	Main clock output	Output	
X_{CIN}	Sub-clock input	Input	I/O pins of the sub-clock generating circuit. Connect a 32 kHz quartz-crystal oscillator between pins X_{CIN} and X_{COUT}. A feedback resistor is built-in between them.
X_{COUT}	Sub-clock output	Output	
D_0–D_7	I/O port D Input is examined by skip decision.	I/O	Each pin of port D has an independent 1-bit wide I/O function. The output structure can be switched to N-channel open-drain or CMOS by software. For input use, set the latch of the specified bit to “1” and select the N-channel open-drain. Port D_7 is also used as CNTR0 pin.
D_8, D_9	Output port D	Output	Each pin of port D has an independent 1-bit wide output function. The output structure is N-channel open-drain. Ports D_8 and D_9 are also used as INT0 pin and INT1 pin, respectively.
$P0_0$–$P0_3$	I/O port P0	I/O	Port P0 serves as a 4-bit I/O port. The output structure can be switched to N-channel open-drain or CMOS by software. For input use, set the latch of the specified bit to “1” and select the N-channel open-drain. Port P0 has a key-on wakeup function and a pull-up function. Both functions can be switched by software.
$P1_0$–$P1_3$	I/O port P1	I/O	Port P1 serves as a 4-bit I/O port. The output structure can be switched to N-channel open-drain or CMOS by software. For input use, set the latch of the specified bit to “1” and select the N-channel open-drain. Port P1 has a key-on wakeup function and a pull-up function. Both functions can be switched by software.
$P2_0$–$P2_3$	Input port P2	Input	Port P2 serves as a 4-bit input port. Ports $P2_0$–$P2_3$ are also used as SEG_{31}–SEG_{28}, respectively.
$P3_0$–$P3_3$	Input port P3	Input	Port P3 serves as a 4-bit input port. Ports $P3_0$–$P3_3$ are also used as SEG_{27}–SEG_{24}, respectively.
Port C	Output port C	Output	1-bit output port. The output structure is CMOS. Port C is also used as CNTR1 pin.
COM_0–COM_3	Common output	Output	LCD common output pins. Pins COM_0 and COM_1 are used at 1/2 duty, pins COM_0–COM_2 are used at 1/3 duty and pins COM_0–COM_3 are used at 1/4 duty.
SEG_0–SEG_{31}	Segment output	Output	LCD segment output pins. SEG_0–SEG_2 pins are used as V_{LC3}–V_{LC1} pins, respectively.
V_{LC3}–V_{LC1}	LCD power supply	–	LCD power supply pins. When the internal resistor is used, V_{DD} pin is connected to V_{LC3} pin (if luminance adjustment is required, V_{DD} pin is connected to V_{LC3} pin through a resistor). When the external power supply is used, apply the voltage $0 \le V_{LC1} \le V_{LC2} \le V_{LC3} \le V_{DD}$. V_{LC3}–V_{LC1} pins are used as SEG_0–SEG_2 pins, respectively.
CNTR0, CNTR1	Timer input/output	I/O	CNTR0 pin has the function to input the clock for the timer 1 event counter, and to output the timer 1 or timer 2 underflow signal divided by 2. CNTR1 pin has the function to input the clock for the timer 3 event counter, and to output the PWM signal generated by timer 4.CNTR0 pin and CNTR1 pin are also used as Ports D_7 and C, respectively.
INT0, INT1	Interrupt input	Input	INT0 pin and INT1 pin accept external interrupts. They have the key-on wakeup function which can be switched by software. INT0 pin and INT1 pin are also used as Ports D_8 and D_9, respectively.

MULTIFUNCTION

Pin	Multifunction	Pin	Multifunction	Pin	Multifunction	Pin	Multifunction
C	CNTR1	CNTR1	C	$P2_0$	SEG_{31}	SEG_{31}	$P2_0$
D_7	CNTR0	CNTR0	D_7	$P2_1$	SEG_{30}	SEG_{30}	$P2_1$
D_8	INT0	INT0	D_8	$P2_2$	SEG_{29}	SEG_{29}	$P2_2$
D_9	INT1	INT1	D_9	$P2_3$	SEG_{28}	SEG_{28}	$P2_3$
V_{LC3}	SEG_0	SEG_0	V_{LC3}	$P3_0$	SEG_{27}	SEG_{27}	$P3_0$
V_{LC2}	SEG_1	SEG_1	V_{LC2}	$P3_1$	SEG_{26}	SEG_{26}	$P3_1$
V_{LC1}	SEG_2	SEG_2	V_{LC1}	$P3_2$	SEG_{25}	SEG_{25}	$P3_2$
				$P3_3$	SEG_{24}	SEG_{24}	$P3_3$

Notes 1: Pins except above have just single function.
2: The output of D_8 and D_9 can be used even when INT0 and INT1 are selected.
3: The input/output of D_7 can be used even when CNTR0 (input) is selected.
4: The input of D_7 can be used even when CNTR0 (output) is selected.
5: The port C "H" output function can be used even when CNTR1 (output) is selected.

DEFINITION OF CLOCK AND CYCLE

● Operation source clock
The operation source clock is the source clock to operate this product. In this product, the following clocks are used.
• Clock ($f(X_{IN})$) by the external ceramic resonator
• Clock ($f(X_{IN})$) by the external RC oscillation
• Clock ($f(X_{IN})$) by the external input
• Clock (f(RING)) of the on-chip oscillator which is the internal oscillator
• Clock ($f(X_{CIN})$) by the external quartz-crystal oscillation

● System clock (STCK)
The system clock is the basic clock for controlling this product. The system clock is selected by the clock control register MR shown as the table below.

● Instruction clock (INSTCK)
The instruction clock is the basic clock for controlling CPU. The instruction clock (INSTCK) is a signal derived by dividing the system clock (STCK) by 3. The one instruction clock cycle generates the one machine cycle.

● Machine cycle
The machine cycle is the standard cycle required to execute the instruction.

Table Selection of system clock

Register MR				System clock	Operation mode
MR_3	MR_2	MR_1	MR_0		
0	0	0	0	$f(STCK) = f(X_{IN})$ or f(RING)	High-speed through mode
		0 or 1	1	$f(STCK) = f(X_{CIN})$	Low-speed through mode
0	1	0	0	$f(STCK) = f(X_{IN})/2$ or f(RING)/2	High-speed frequency divided by 2 mode
		0 or 1	1	$f(STCK) = f(X_{CIN})/2$	Low-speed frequency divided by 2 mode
1	0	0	0	$f(STCK) = f(X_{IN})/4$ or f(RING)/4	High-speed frequency divided by 4 mode
		0 or 1	1	$f(STCK) = f(X_{CIN})/4$	Low-speed frequency divided by 4 mode
1	1	0	0	$f(STCK) = f(X_{IN})/8$ or f(RING)/8	High-speed frequency divided by 8 mode
		0 or 1	1	$f(STCK) = f(X_{CIN})/8$	Low-speed frequency divided by 8 mode

Note: The f(RING)/8 is selected after system is released from reset.

PORT FUNCTION

Port	Pin	Input Output	Output structure	I/O unit	Control instructions	Control registers	Remark
Port D	D_0–D_6, D_7/CNTR0	I/O (8)	N-channel open-drain/ CMOS	1	SD, RD SZD CLD	FR1, FR2 W6	Output structure selection function (programmable)
	D_8/INT0, D_9/INT1	Output (2)	N-channel open-drain			I1, I2 K2	Key-on wakeup function (programmable)
Port P0	$P0_0$–$P0_3$	I/O (4)	N-channel open-drain/ CMOS	4	OP0A IAP0	FR0 PU0 K0	Built-in programmable pull-up functions and key-on wakeup functions (programmable)
Port P1	$P1_0$–$P1_3$	I/O (4)	N-channel open-drain/ CMOS	4	OP1A IAP1	FR0 PU1 K1	Built-in programmable pull-up functions and key-on wakeup functions (programmable)
Port P2	SEG_{31}/$P2_0$–SEG_{28}/$P2_3$	Input (4)		4	IAP2	L3	
Port P3	SEG_{27}/$P3_0$–SEG_{24}/$P3_3$	Input (4)		4	IAP3	L3	
Port C	C/CNTR1	Output (1)	CMOS	1	RCP SCP	W4	

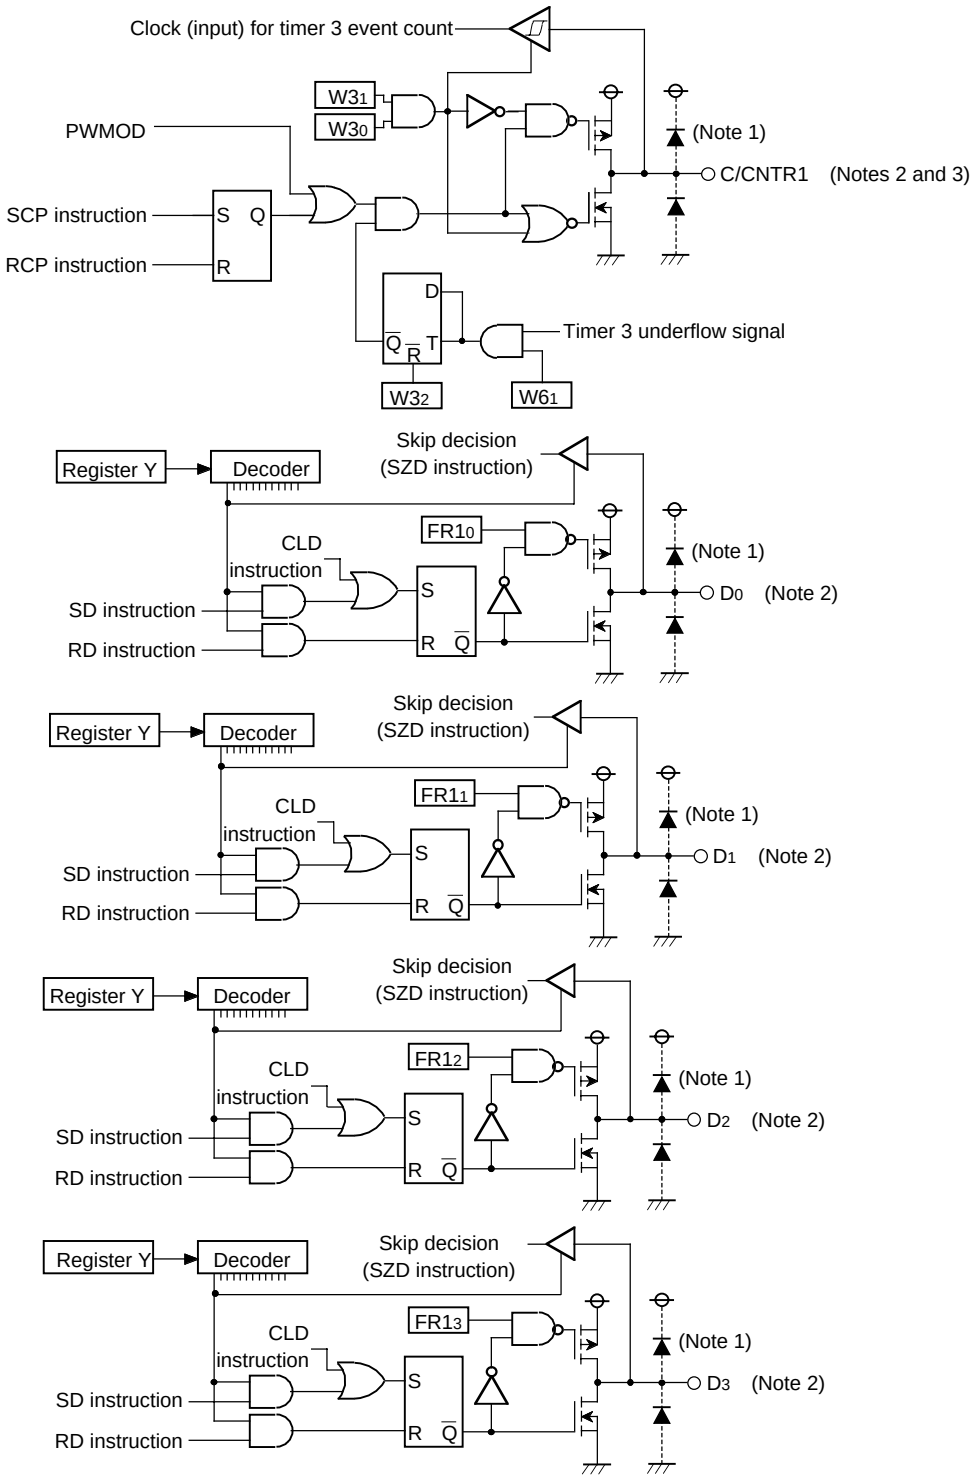
CONNECTIONS OF UNUSED PINS

Pin	Connection	Usage condition
X_{IN}	Connect to V_{SS}.	Internal oscillator is selected (CMCK and CRCK instructions are not executed.) (Note 1) Sub-clock input is selected for system clock (MR_0=1). (Note 2)
X_{OUT}	Open.	Internal oscillator is selected (CMCK and CRCK instructions are not executed.) (Note 1) RC oscillator is selected (CRCK instruction is executed) External clock input is selected for main clock (CMCK instruction is executed). (Note 3) Sub-clock input is selected for system clock (MR_0=1). (Note 2)
X_{CIN}	Connect to V_{SS}.	Sub-clock is not used.
X_{COUT}	Open.	Sub-clock is not used. External clock input is selected for sub-clock.
D_0–D_6	Open.	(Note 4)
	Connect to V_{SS}.	N-channel open-drain is selected for the output structure.
D_7/CNTR0	Open.	CNTR0 input is not selected for timer 1 count source.
	Connect to V_{SS}.	N-channel open-drain is selected for the output structure.
D_8/INT0	Open.	"0" is set to output latch.
	Connect to V_{SS}.	————
D_9/INT1	Open.	"0" is set to output latch.
	Connect to V_{SS}.	————
C/CNTR1	Open.	CNTR1 input is not selected for timer 3 count source.
$P0_0$–$P0_3$	Open.	The key-on wakeup function is not selected. (Note 4)
	Connect to Vss.	N-channel open-drain is selected for the output structure. (Note 5) The pull-up function is not selected. (Note 4) The key-on wakeup function is not selected. (Note 4)
$P1_0$–$P1_3$	Open.	The key-on wakeup function is not selected. (Note 4)
	Connect to Vss.	N-channel open-drain is selected for the output structure. (Note 5) The pull-up function is not selected. (Note 4) The key-on wakeup function is not selected. (Note 4)
SEG_{31}/$P2_0$–	Open.	————
SEG_{28}/$P2_3$	Connect to Vss.	Ports $P2_0$–$P2_3$ selected.
SEG_{27}/$P3_0$–	Open.	————
SEG_{24}/$P3_3$	Connect to Vss.	Ports $P3_0$–$P3_3$ selected.
COM_0–COM_3	Open.	————
SEG_0/V_{LC3}	Open.	SEG_0 pin is selected.
SEG_1/V_{LC2}	Open.	SEG_1 pin is selected.
SEG_2/V_{LC1}	Open.	SEG_2 pin is selected.
SEG_3–SEG_{23}	Open.	————

Notes 1: When the CMCK and CRCK instructions are not executed, the internal oscillation (on-chip oscillator) is selected for main clock.
2: When sub-clock (X_{CIN}) input is selected (MR_0 = 1) for the system clock by setting "1" to bit 1 (MR_1) of clock control register MR, main clock is stopped.
3: Select the ceramic resonance by executing the CMCK instruction to use the external clock input for the main clock.
4: Be sure to select the output structure of ports D_0–D_6 and the pull-up function and key-on wakeup function of $P0_0$–$P0_3$ and $P1_0$–$P1_3$ with every one port. Set the corresponding bits of registers for each port.
5: Be sure to select the output structure of ports $P0_0$–$P0_3$ and $P1_0$–$P1_3$ with every two ports. If only one of the two pins is used, leave another one open.

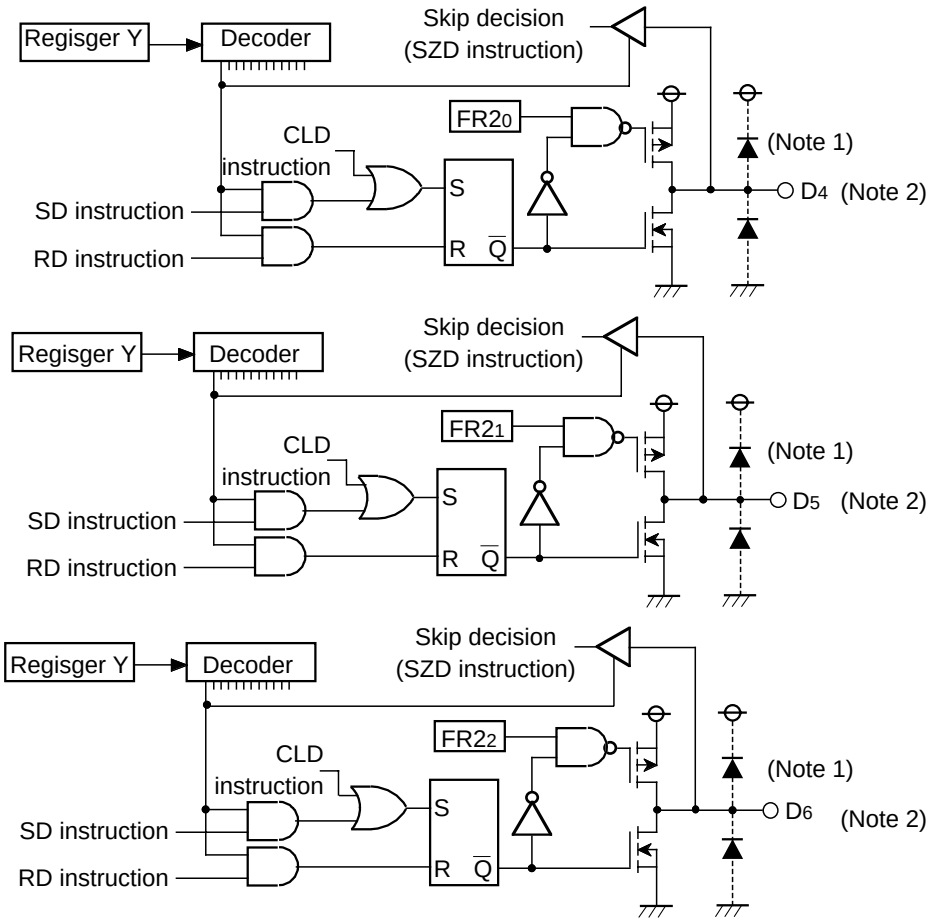
(Note when connecting to V_{SS} and V_{DD})
● Connect the unused pins to V_{SS} and V_{DD} using the thickest wire at the shortest distance against noise.

PORT BLOCK DIAGRAMS



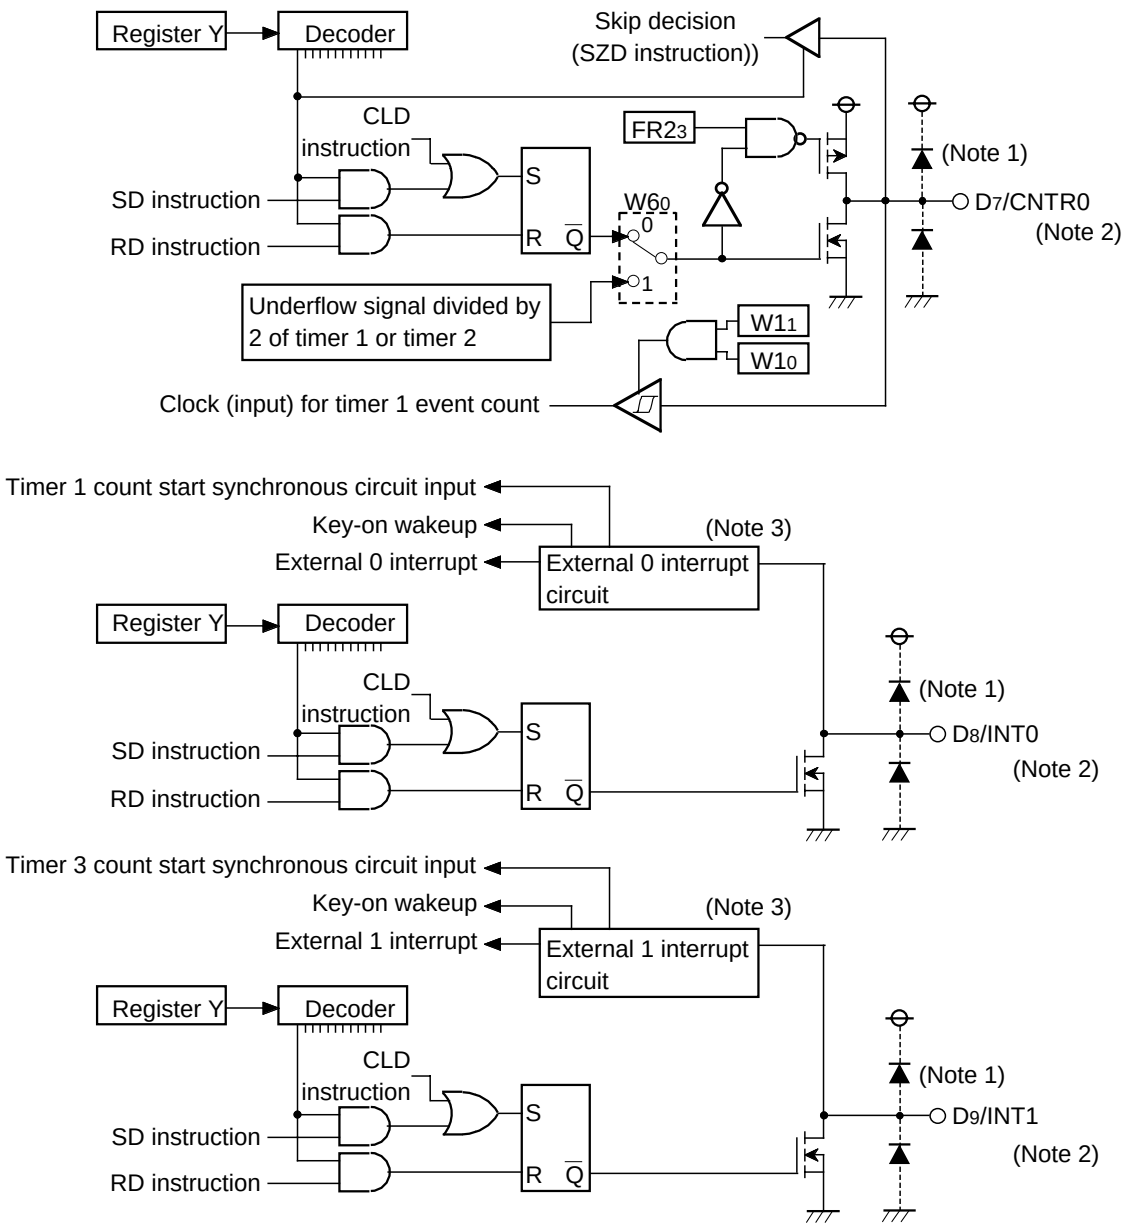
Notes 1: This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.
3: When CNTR1 input is selected, output transistor is turned OFF.

Port block diagram (1)



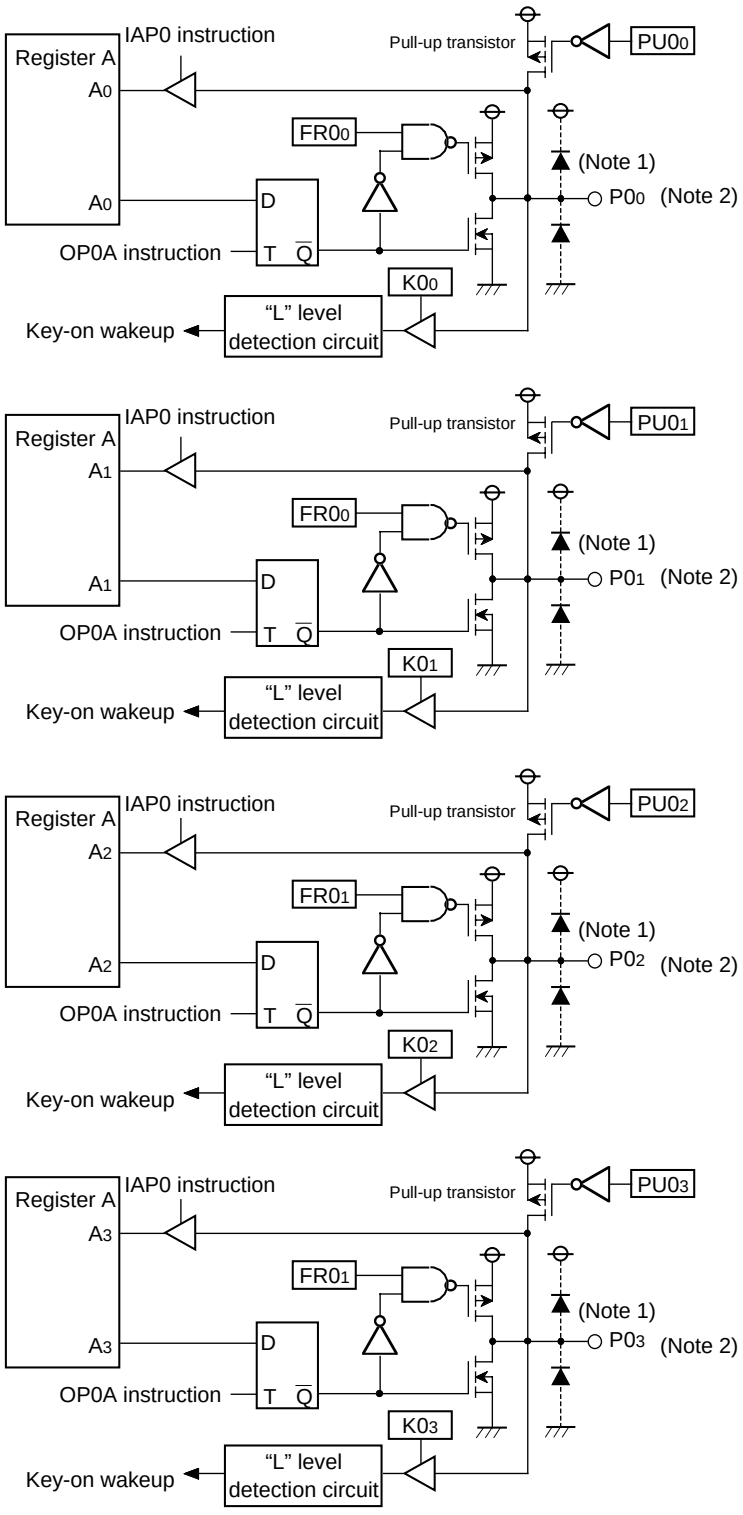
Notes 1: ----|◀----This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.

Port block diagram (2)



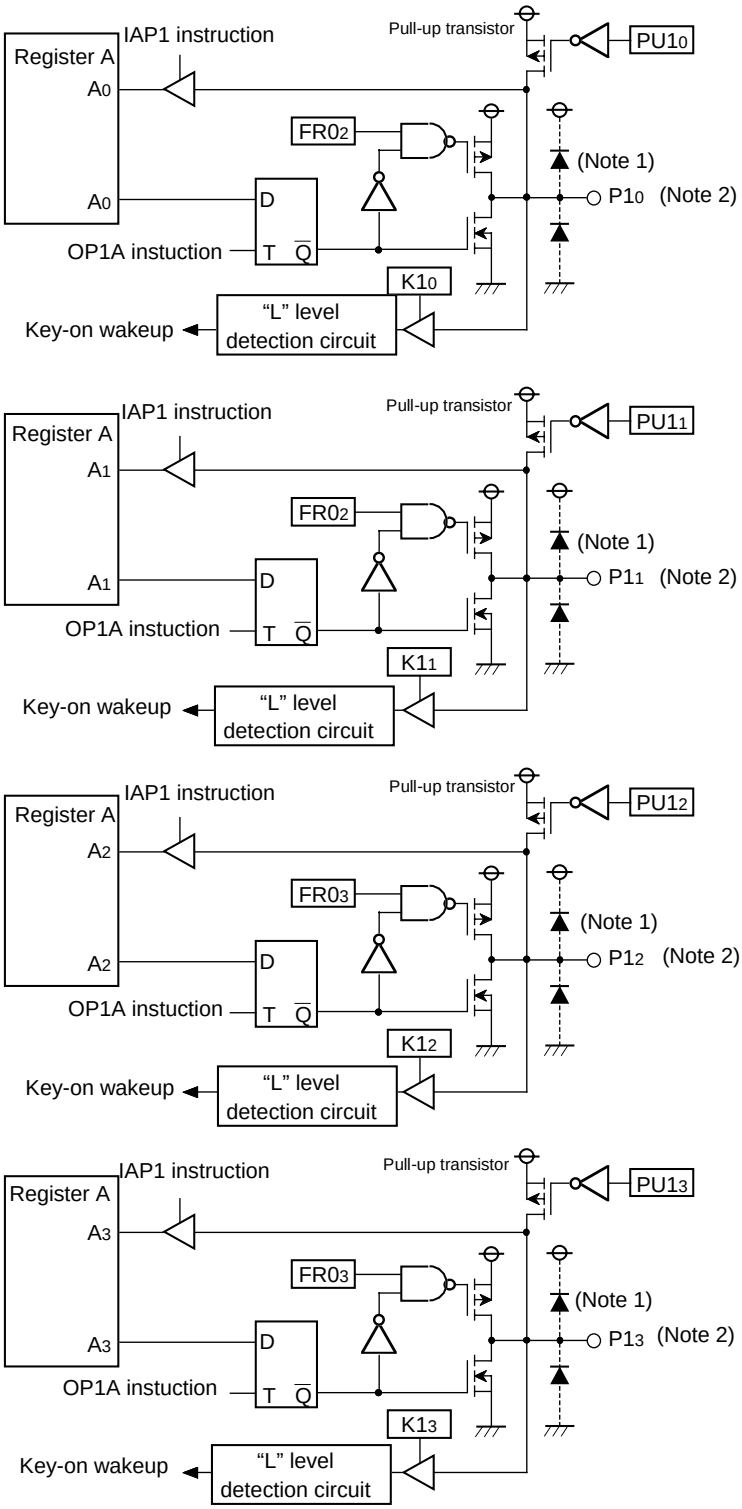
Notes 1: ----|◀---- This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.
3: As for details, refer to the description of external interrupt circuit.

Port block diagram (3)



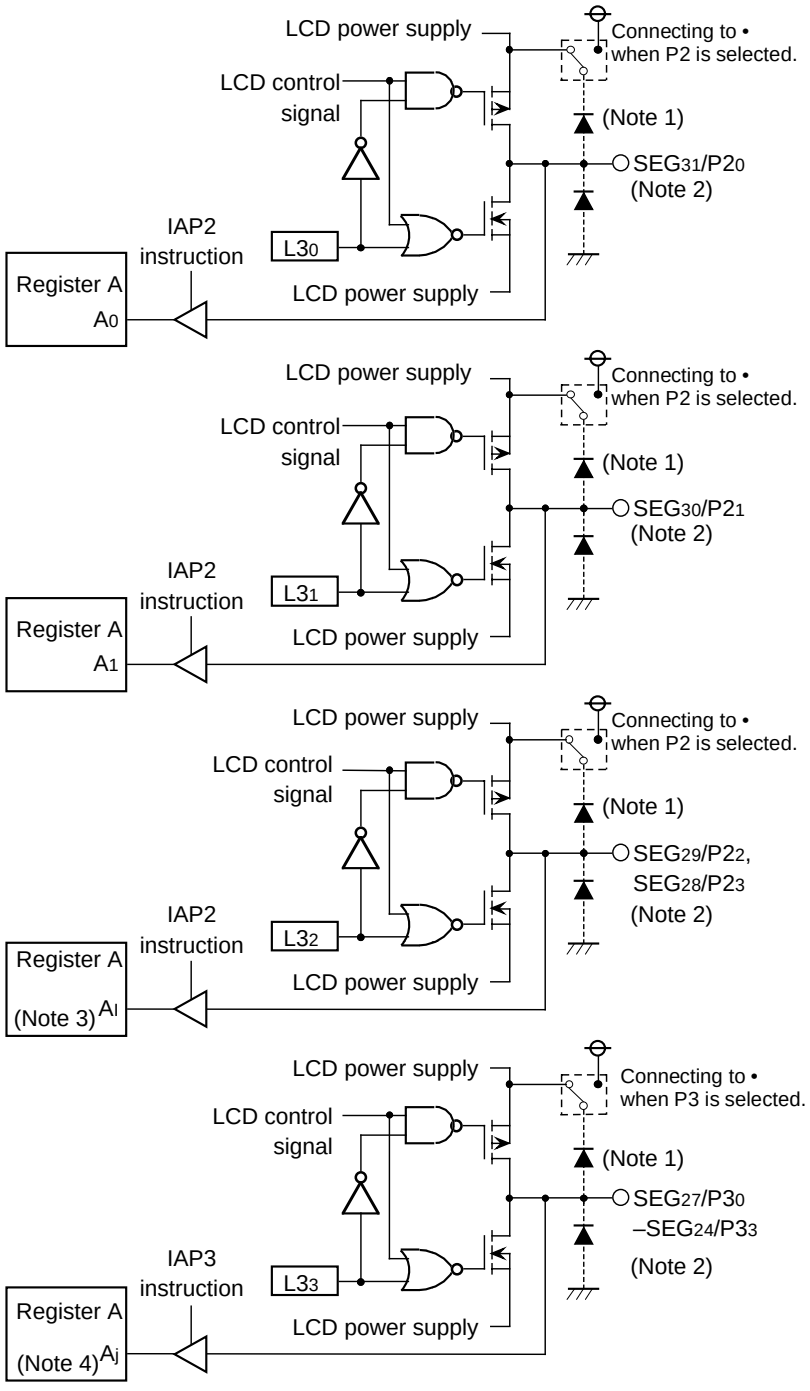
Notes 1: ----|◄---- This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.

Port block diagram (4)



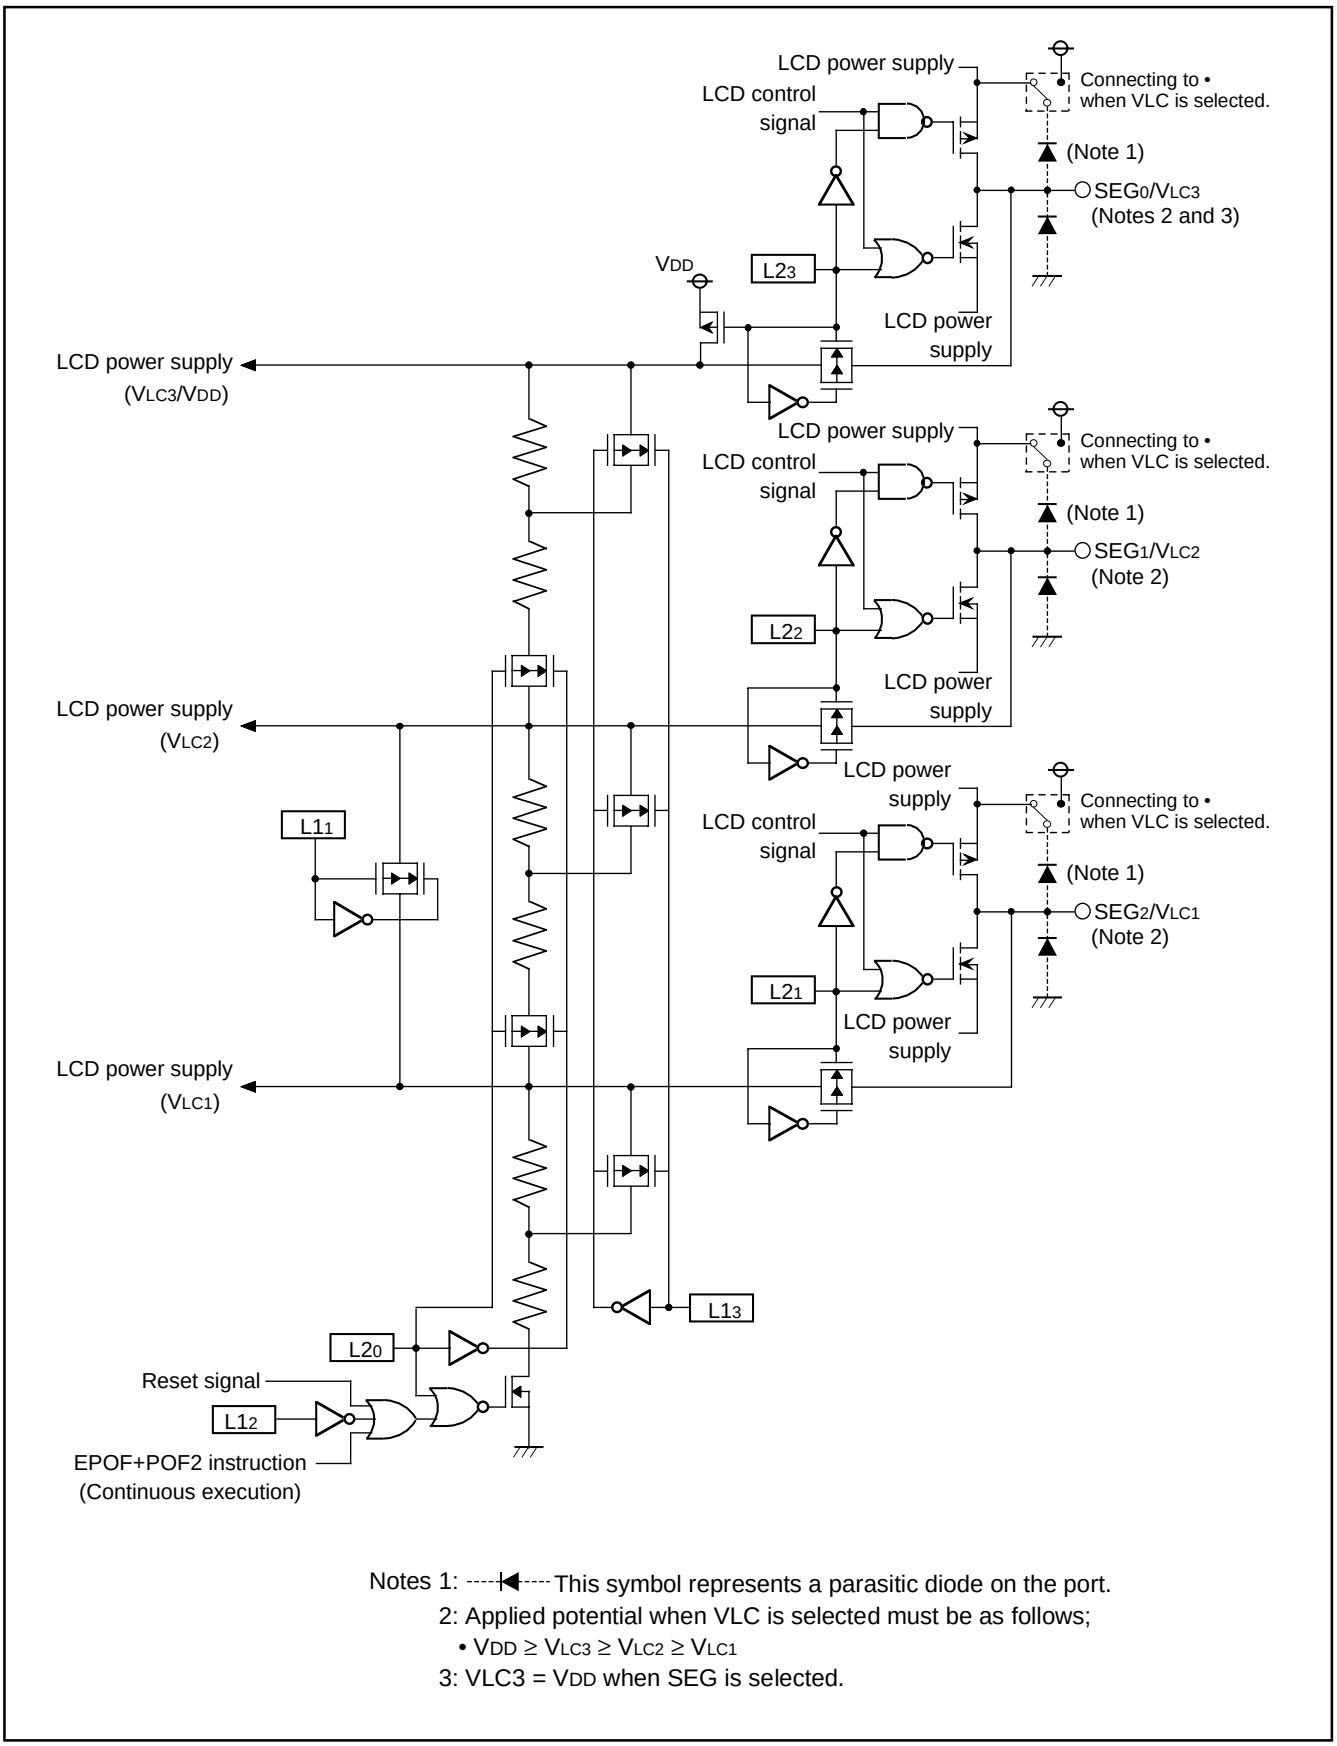
Notes 1: ----|◄---- This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.

Port block diagram (5)



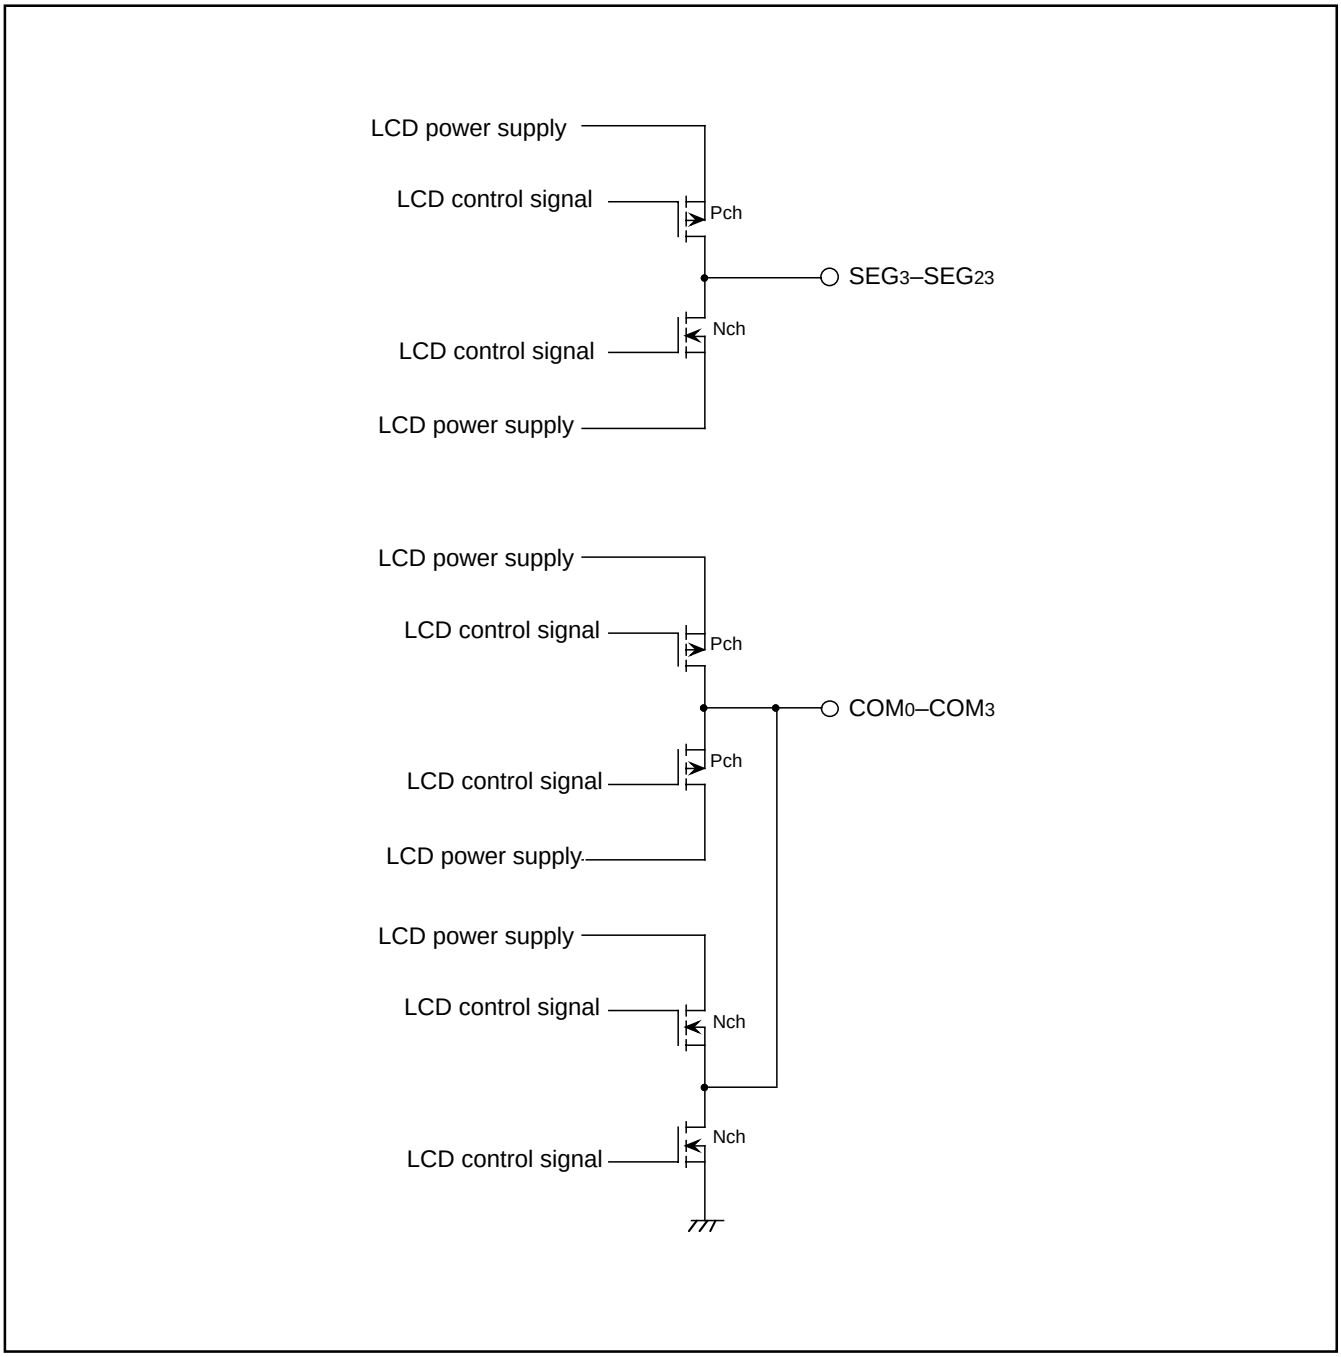
Notes 1: ----◄---- This symbol represents a parasitic diode on the port.
2: Applied potential to these ports must be V_{DD} or less.
3: i represents 0, 1.
4: j represents 0 to 3.

Port block diagram (6)



Notes 1: ----◄---- This symbol represents a parasitic diode on the port.
2: Applied potential when VLC is selected must be as follows;
• $V_{DD} \geq V_{LC3} \geq V_{LC2} \geq V_{LC1}$
3: VLC3 = V_{DD} when SEG is selected.

Port block diagram (7)



Port block diagram (8)

FUNCTION BLOCK OPERATIONS
CPU

(1) Arithmetic logic unit (ALU)

The arithmetic logic unit ALU performs 4-bit arithmetic such as 4-bit data addition, comparison, AND operation, OR operation, and bit manipulation.

(2) Register A and carry flag

Register A is a 4-bit register used for arithmetic, transfer, exchange, and I/O operation.

Carry flag CY is a 1-bit flag that is set to “1” when there is a carry with the AMC instruction (Figure 1).

It is unchanged with both A n instruction and AM instruction. The value of A_0 is stored in carry flag CY with the RAR instruction (Figure 2).

Carry flag CY can be set to “1” with the SC instruction and cleared to “0” with the RC instruction.

(3) Registers B and E

Register B is a 4-bit register used for temporary storage of 4-bit data, and for 8-bit data transfer together with register A.

Register E is an 8-bit register. It can be used for 8-bit data transfer with register B used as the high-order 4 bits and register A as the low-order 4 bits (Figure 3).

Register E is undefined after system is released from reset and returned from the RAM back-up. Accordingly, set the initial value.

(4) Register D

Register D is a 3-bit register.

It is used to store a 7-bit ROM address together with register A and is used as a pointer within the specified page when the TABP p, BLA p, or BMLA p instruction is executed (Figure 4).

Register D is undefined after system is released from reset and returned from the RAM back-up. Accordingly, set the initial value.

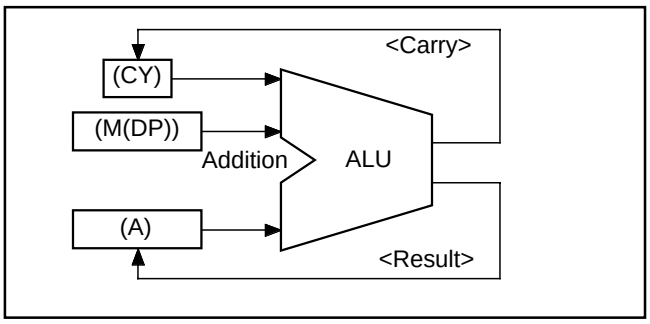


Fig. 1 AMC instruction execution example

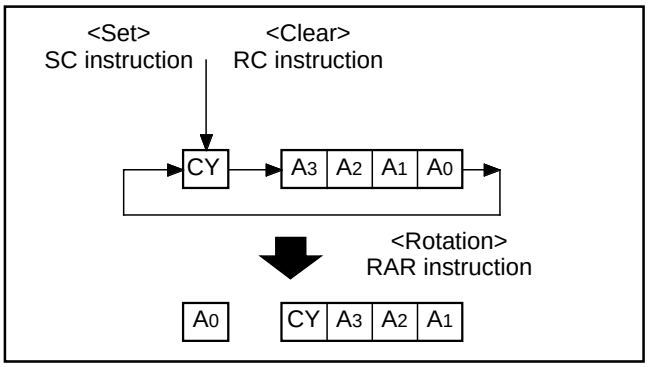

Fig. 2 RAR instruction execution example

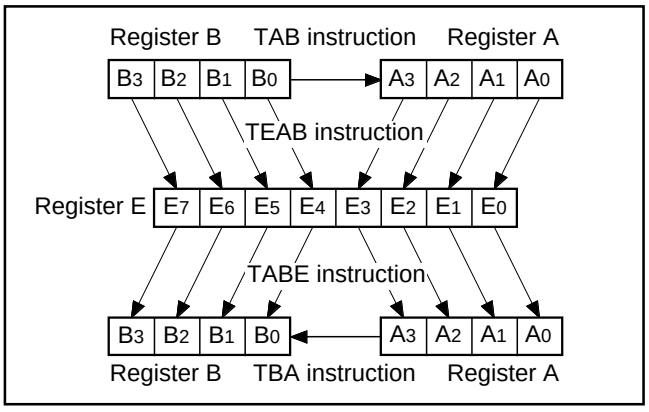

Fig. 3 Registers A, B and register E

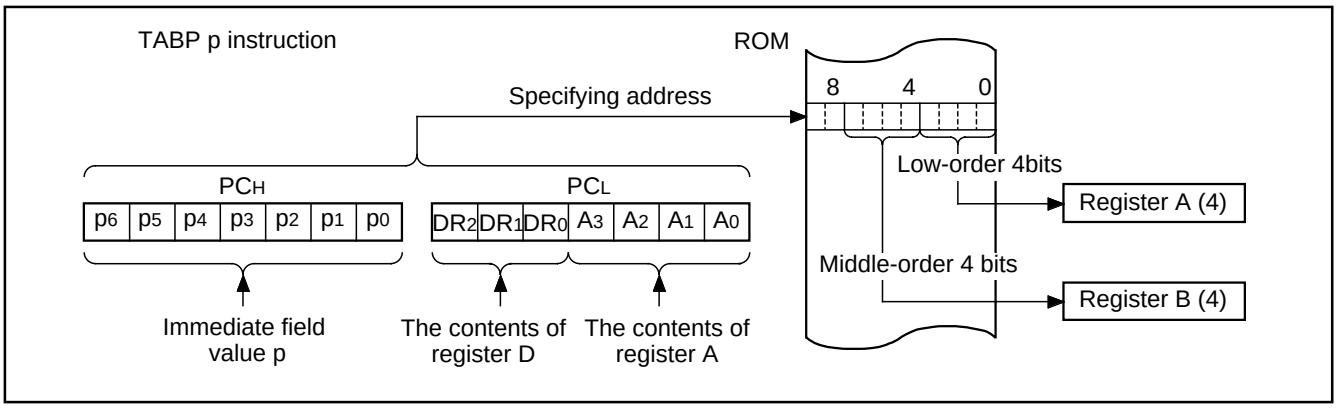

Fig. 4 TABP p instruction execution example

(5) Stack registers (SKs) and stack pointer (SP)

Stack registers (SKs) are used to temporarily store the contents of program counter (PC) just before branching until returning to the original routine when;

- branching to an interrupt service routine (referred to as an interrupt service routine),
- performing a subroutine call, or
- executing the table reference instruction (TABP p).

Stack registers (SKs) are eight identical registers, so that subroutines can be nested up to 8 levels. However, one of stack registers is used respectively when using an interrupt service routine and when executing a table reference instruction. Accordingly, be careful not to over the stack when performing these operations together. The contents of registers SKs are destroyed when 8 levels are exceeded.

The register SK nesting level is pointed automatically by 3-bit stack pointer (SP). The contents of the stack pointer (SP) can be transferred to register A with the TASP instruction.

Figure 5 shows the stack registers (SKs) structure.

Figure 6 shows the example of operation at subroutine call.

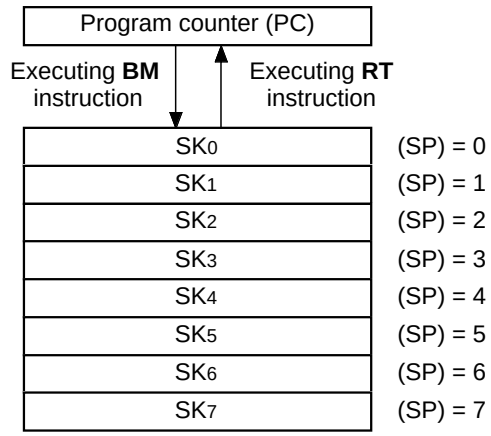
(6) Interrupt stack register (SDP)

Interrupt stack register (SDP) is a 1-stage register. When an interrupt occurs, this register (SDP) is used to temporarily store the contents of data pointer, carry flag, skip flag, register A, and register B just before an interrupt until returning to the original routine.

Unlike the stack registers (SKs), this register (SDP) is not used when executing the subroutine call instruction and the table reference instruction.

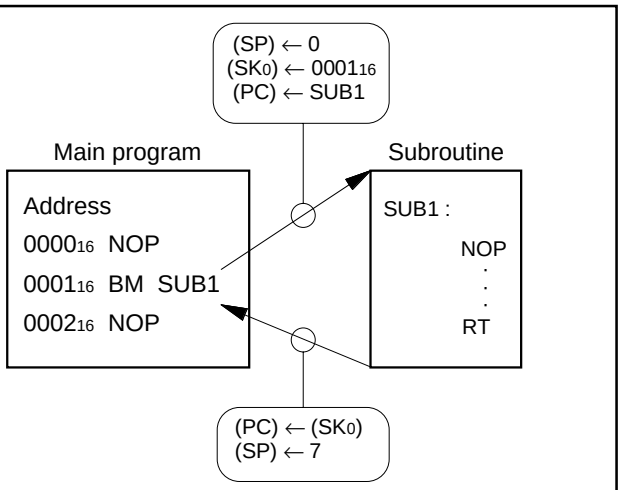
(7) Skip flag

Skip flag controls skip decision for the conditional skip instructions and continuous described skip instructions. When an interrupt occurs, the contents of skip flag is stored automatically in the interrupt stack register (SDP) and the skip condition is retained.



Stack pointer (SP) points "7" at reset or returning from RAM back-up mode. It points "0" by executing the first **BM** instruction, and the contents of program counter is stored in SK_0.
When the **BM** instruction is executed after eight stack registers are used ((SP) = 7), (SP) = 0 and the contents of SK_0 is destroyed.

Fig. 5 Stack registers (SKs) structure



Note : Returning to the **BM** instruction execution address with the **RT** instruction, and the **BM** instruction becomes the **NOP** instruction.

Fig. 6 Example of operation at subroutine call

(8) Program counter (PC)

Program counter (PC) is used to specify a ROM address (page and address). It determines a sequence in which instructions stored in ROM are read. It is a binary counter that increments the number of instruction bytes each time an instruction is executed. However, the value changes to a specified address when branch instructions, subroutine call instructions, return instructions, or the table reference instruction (TABP p) is executed.

Program counter consists of PC_H (most significant bit to bit 7) which specifies to a ROM page and PC_L (bits 6 to 0) which specifies an address within a page. After it reaches the last address (address 127) of a page, it specifies address 0 of the next page (Figure 7).

Make sure that the PC_H does not specify after the last page of the built-in ROM.

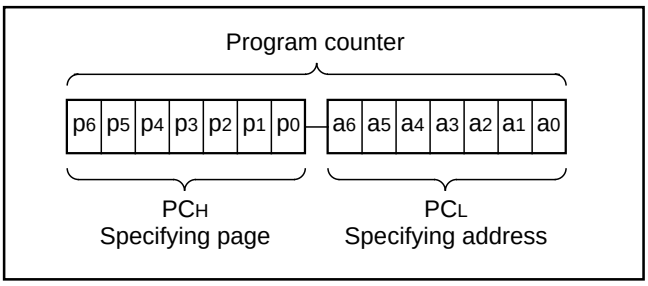


Fig. 7 Program counter (PC) structure

(9) Data pointer (DP)

Data pointer (DP) is used to specify a RAM address and consists of registers Z, X, and Y. Register Z specifies a RAM file group, register X specifies a file, and register Y specifies a RAM digit (Figure 8).

Register Y is also used to specify the port D bit position.

When using port D, set the port D bit position to register Y certainly and execute the SD, RD, or SZD instruction (Figure 9).

• Note

Register Z of data pointer is undefined after system is released from reset.

Also, registers Z, X and Y are undefined in the RAM back-up. After system is returned from the RAM back-up, set these registers.

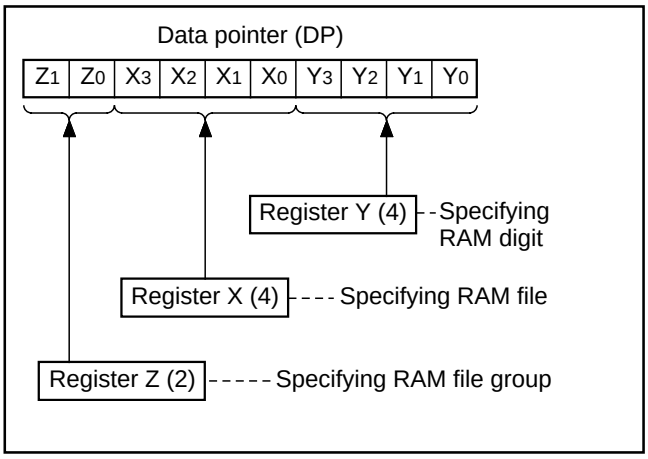

Fig. 8 Data pointer (DP) structure

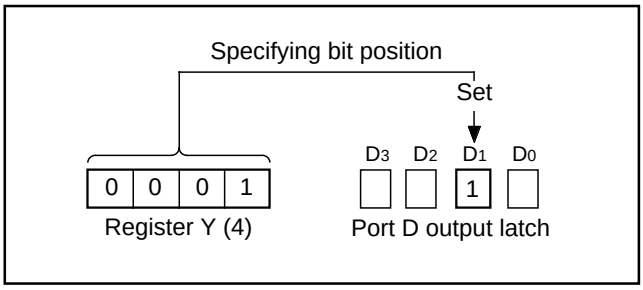

Fig. 9 SD instruction execution example

PROGRAM MEMORY (ROM)

The program memory is a mask ROM. 1 word of ROM is composed of 10 bits. ROM is separated every 128 words by the unit of page (addresses 0 to 127). Table 1 shows the ROM size and pages. Figure 10 shows the ROM map of M34554ED.

Table 1 ROM size and pages

Part number	ROM (PROM) size (× 10 bits)	Pages
M34554M8	8192 words	64 (0 to 63)
M34554MC	12288 words	96 (0 to 95)
M34554ED	16384 words	128 (0 to 127)

Note: Data in pages 64 to 127 can be referred with the TABP p instruction after the SBK instruction is executed.
Data in pages 0 to 63 can be referred with the TABP p instruction after the RBK instruction is executed.

A part of page 1 (addresses 0080_{16} to $00FF_{16}$) is reserved for interrupt addresses (Figure 11). When an interrupt occurs, the address (interrupt address) corresponding to each interrupt is set in the program counter, and the instruction at the interrupt address is executed. When using an interrupt service routine, write the instruction generating the branch to that routine at an interrupt address.

Page 2 (addresses 0100_{16} to $017F_{16}$) is the special page for subroutine calls. Subroutines written in this page can be called from any page with the 1-word instruction (BM). Subroutines extending from page 2 to another page can also be called with the BM instruction when it starts on page 2.

ROM pattern (bits 7 to 0) of all addresses can be used as data areas with the TABP p instruction.

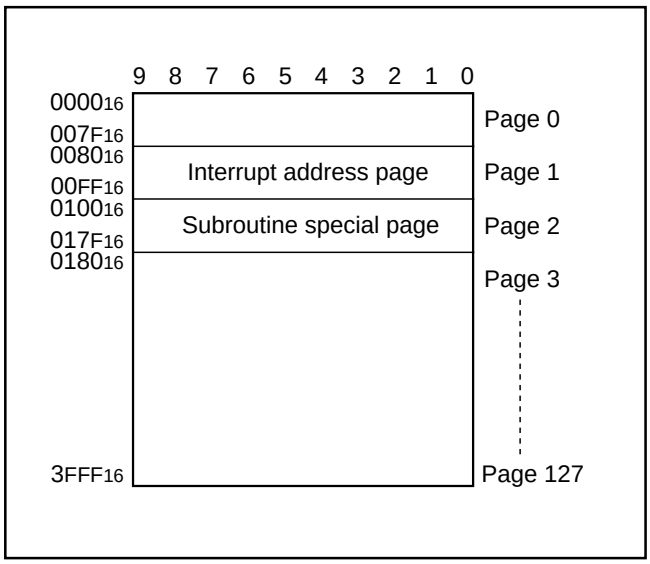

Fig. 10 ROM map of M34554ED

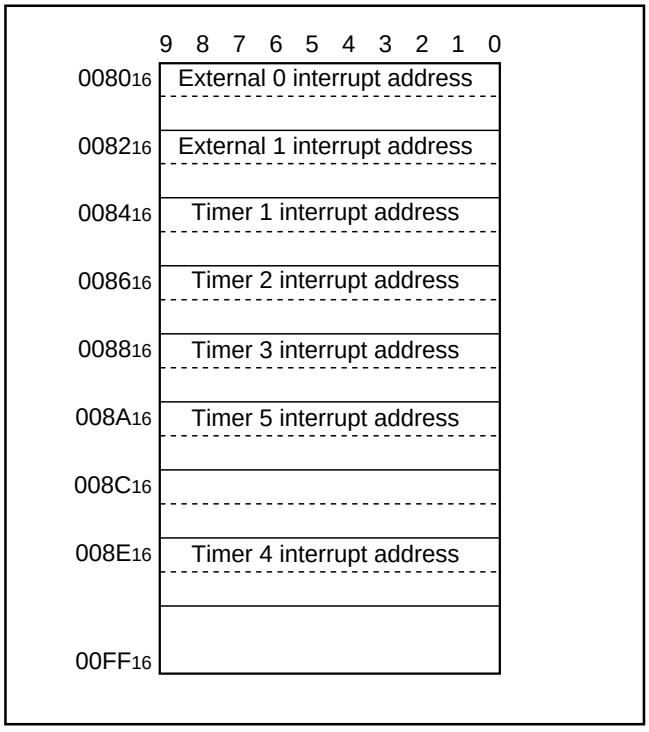

Fig. 11 Page 1 (addresses 0080_{16} to $00FF_{16}$) structure

DATA MEMORY (RAM)

1 word of RAM is composed of 4 bits, but 1-bit manipulation (with the SB j, RB j, and SZB j instructions) is enabled for the entire memory area. A RAM address is specified by a data pointer. The data pointer consists of registers Z, X, and Y. Set a value to the data pointer certainly when executing an instruction to access RAM (also, set a value after system returns from RAM back-up).
RAM includes the area for LCD.
When writing “1” to a bit corresponding to displayed segment, the segment is turned on.
Table 2 shows the RAM size. Figure 12 shows the RAM map.

• Note
Register Z of data pointer is undefined after system is released from reset.
Also, registers Z, X and Y are undefined in the RAM back-up. After system is returned from the RAM back-up, set these registers.

Table 2 RAM size

Part number	RAM size
M34554M8	512 words × 4 bits (2048 bits)
M34554MC	512 words × 4 bits (2048 bits)

Fig. 12 RAM map

INTERRUPT FUNCTION

The interrupt type is a vectored interrupt branching to an individual address (interrupt address) according to each interrupt source. An interrupt occurs when the following 3 conditions are satisfied.

- An interrupt activated condition is satisfied (request flag = "1")
- Interrupt enable bit is enabled ("1")
- Interrupt enable flag is enabled (INTE = "1")

Table 3 shows interrupt sources. (Refer to each interrupt request flag for details of activated conditions.)

(1) Interrupt enable flag (INTE)

The interrupt enable flag (INTE) controls whether the every interrupt enable/disable. Interrupts are enabled when INTE flag is set to "1" with the EI instruction and disabled when INTE flag is cleared to "0" with the DI instruction. When any interrupt occurs, the INTE flag is automatically cleared to "0," so that other interrupts are disabled until the EI instruction is executed.

(2) Interrupt enable bit

Use an interrupt enable bit of interrupt control registers V1 and V2 to select the corresponding interrupt or skip instruction.

Table 4 shows the interrupt request flag, interrupt enable bit and skip instruction.

Table 5 shows the interrupt enable bit function.

(3) Interrupt request flag

When the activated condition for each interrupt is satisfied, the corresponding interrupt request flag is set to "1." Each interrupt request flag is cleared to "0" when either;

- an interrupt occurs, or
- the next instruction is skipped with a skip instruction.

Each interrupt request flag is set when the activated condition is satisfied even if the interrupt is disabled by the INTE flag or its interrupt enable bit. Once set, the interrupt request flag retains set until a clear condition is satisfied.

Accordingly, an interrupt occurs when the interrupt disable state is released while the interrupt request flag is set.

If more than one interrupt request flag is set when the interrupt disable state is released, the interrupt priority level is as follows shown in Table 3.

Table 3 Interrupt sources

Priority level	Interrupt name	Activated condition	Interrupt address
1	External 0 interrupt	Level change of INT0 pin	Address 0 in page 1
2	External 1 interrupt	Level change of INT1 pin	Address 2 in page 1
3	Timer 1 interrupt	Timer 1 underflow	Address 4 in page 1
4	Timer 2 interrupt	Timer 2 underflow	Address 6 in page 1
5	Timer 3 interrupt	Timer 3 underflow	Address 8 in page 1
6	Timer 5 interrupt	Timer 5 underflow	Address A in page 1
7	Timer 4 interrupt	Timer 4 underflow	Address E in page 1

Table 4 Interrupt request flag, interrupt enable bit and skip instruction

Interrupt name	Interrupt request flag	Skip instruction	Interrupt enable bit
External 0 interrupt	EXF0	SNZ0	$V1_0$
External 1 interrupt	EXF1	SNZ1	$V1_1$
Timer 1 interrupt	T1F	SNZT1	$V1_2$
Timer 2 interrupt	T2F	SNZT2	$V1_3$
Timer 3 interrupt	T3F	SNZT3	$V2_0$
Timer 5 interrupt	T5F	SNZT5	$V2_1$
Timer 4 interrupt	T4F	SNZT4	$V2_3$

Table 5 Interrupt enable bit function

Interrupt enable bit	Occurrence of interrupt	Skip instruction
1	Enabled	Invalid
0	Disabled	Valid

(4) Internal state during an interrupt

The internal state of the microcomputer during an interrupt is as follows (Figure 14).

- Program counter (PC)
  An interrupt address is set in program counter. The address to be executed when returning to the main routine is automatically stored in the stack register (SK).
- Interrupt enable flag (INTE)
  INTE flag is cleared to "0" so that interrupts are disabled.
- Interrupt request flag
  Only the request flag for the current interrupt source is cleared to "0."
- Data pointer, carry flag, skip flag, registers A and B
  The contents of these registers and flags are stored automatically in the interrupt stack register (SDP).

(5) Interrupt processing

When an interrupt occurs, a program at an interrupt address is executed after branching a data store sequence to stack register. Write the branch instruction to an interrupt service routine at an interrupt address.

Use the RTI instruction to return from an interrupt service routine.

Interrupt enabled by executing the EI instruction is performed after executing 1 instruction (just after the next instruction is executed). Accordingly, when the EI instruction is executed just before the RTI instruction, interrupts are enabled after returning the main routine. (Refer to Figure 13)

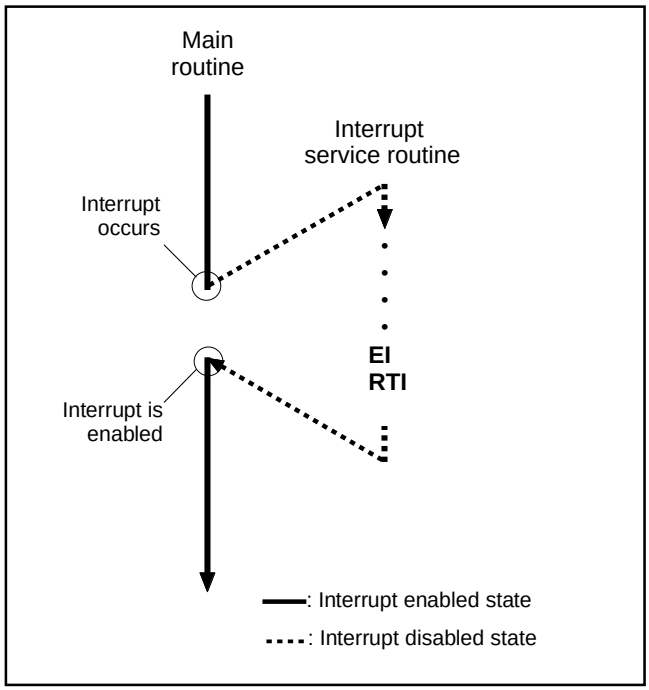

Fig. 13 Program example of interrupt processing

- Program counter (PC) ..... Each interrupt address
- Stack register (SK) ..... The address of main routine to be executed when returning
- Interrupt enable flag (INTE) ..... 0 (Interrupt disabled)
- Interrupt request flag (only the flag for the current interrupt source) 0
- Data pointer, carry flag, registers A and B, skip flag ..... Stored in the interrupt stack register (SDP) automatically

Fig. 14 Internal state when interrupt occurs

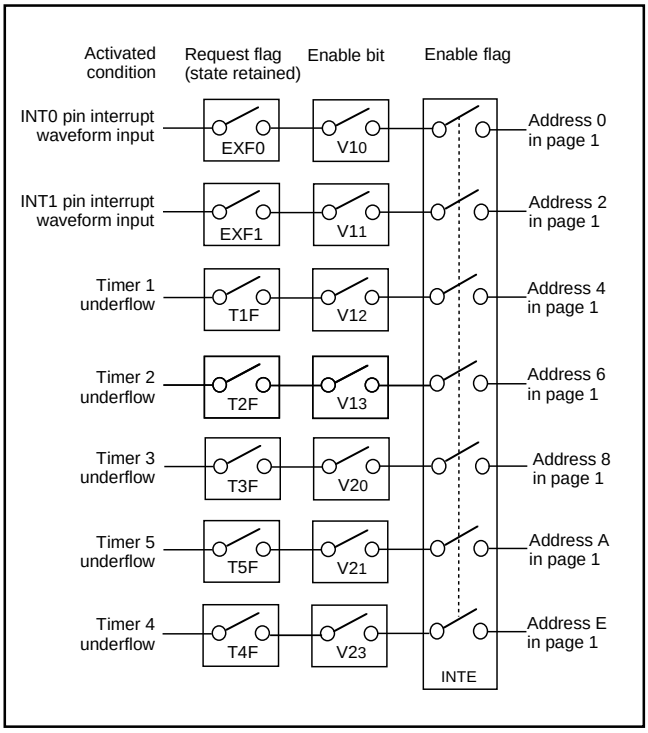

Fig. 15 Interrupt system diagram

(6) Interrupt control registers

- Interrupt control register V1

  Interrupt enable bits of external 0, external 1, timer 1 and timer 2 are assigned to register V1. Set the contents of this register through register A with the TV1A instruction. The TAV1 instruction can be used to transfer the contents of register V1 to register A.

- Interrupt control register V2

  The timer 3, timer 5, timer 4 interrupt enable bit is assigned to register V2. Set the contents of this register through register A with the TV2A instruction. The TAV2 instruction can be used to transfer the contents of register V2 to register A.

Table 6 Interrupt control registers

Interrupt control register V1		at reset : 0000_2		at power down : 0000_2	R/W TAV1/TV1A
$V1_3$	Timer 2 interrupt enable bit	0	Interrupt disabled (SNZT2 instruction is valid)		
		1	Interrupt enabled (SNZT2 instruction is invalid)		
$V1_2$	Timer 1 interrupt enable bit	0	Interrupt disabled (SNZT1 instruction is valid)		
		1	Interrupt enabled (SNZT1 instruction is invalid)		
$V1_1$	External 1 interrupt enable bit	0	Interrupt disabled (SNZ1 instruction is valid)		
		1	Interrupt enabled (SNZ1 instruction is invalid)		
$V1_0$	External 0 interrupt enable bit	0	Interrupt disabled (SNZ0 instruction is valid)		
		1	Interrupt enabled (SNZ0 instruction is invalid)		

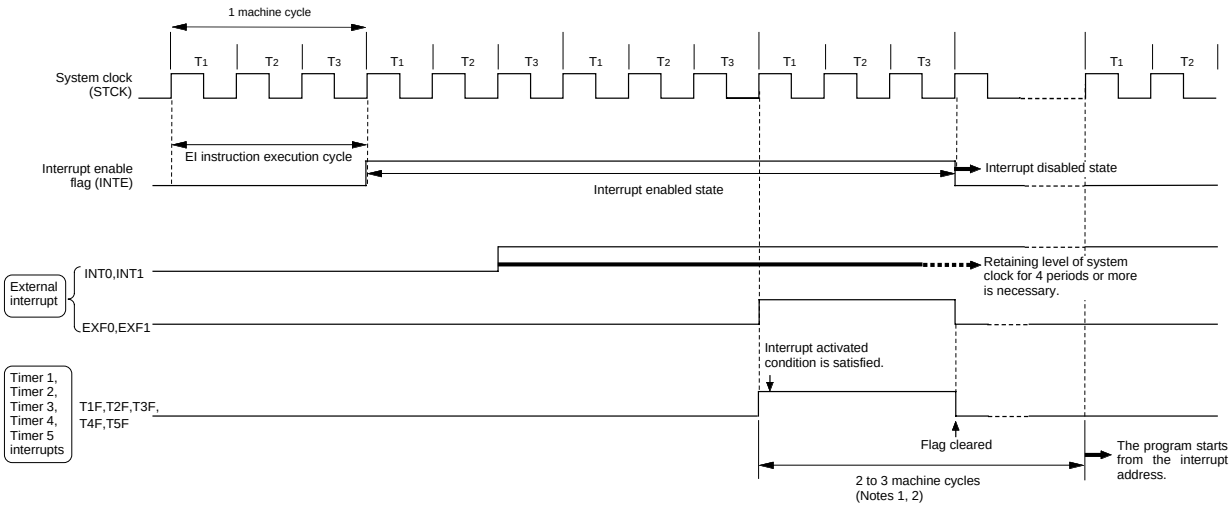
Interrupt control register V2		at reset : 0000_2		at power down : 0000_2	R/W TAV2/TV2A
$V2_3$	Timer 4 interrupt enable bit	0	Interrupt disabled (SNZT4 instruction is valid)		
		1	Interrupt enabled (SNZT4 instruction is invalid)		
$V2_2$	Not used	0	This bit has no function, but read/write is enabled.		
		1			
$V2_1$	Timer 5 interrupt enable bit	0	Interrupt disabled (SNZT5 instruction is valid)		
		1	Interrupt enabled (SNZT5 instruction is invalid)		
$V2_0$	Timer 3 interrupt enable bit	0	Interrupt disabled (SNZT3 instruction is valid)		
		1	Interrupt enabled (SNZT3 instruction is invalid)		

Note: "R" represents read enabled, and "W" represents write enabled.

(7) Interrupt sequence

Interrupts only occur when the respective INTE flag, interrupt enable bits ($V1_0$–$V1_3$, $V2_0$, $V2_1$, $V2_3$), and interrupt request flag are "1." The interrupt actually occurs 2 to 3 machine cycles after the cycle in which all three conditions are satisfied. The interrupt occurs after 3 machine cycles only when the three interrupt conditions are satisfied on execution of other than one-cycle instructions (Refer to Figure 16).

● When an interrupt request flag is set after its interrupt is enabled (Note 1)



Notes 1: The address is stacked to the last cycle.
2: This interval of cycles depends on the executed instruction at the time when each interrupt activated condition is satisfied.

Fig. 16 Interrupt sequence

EXTERNAL INTERRUPTS

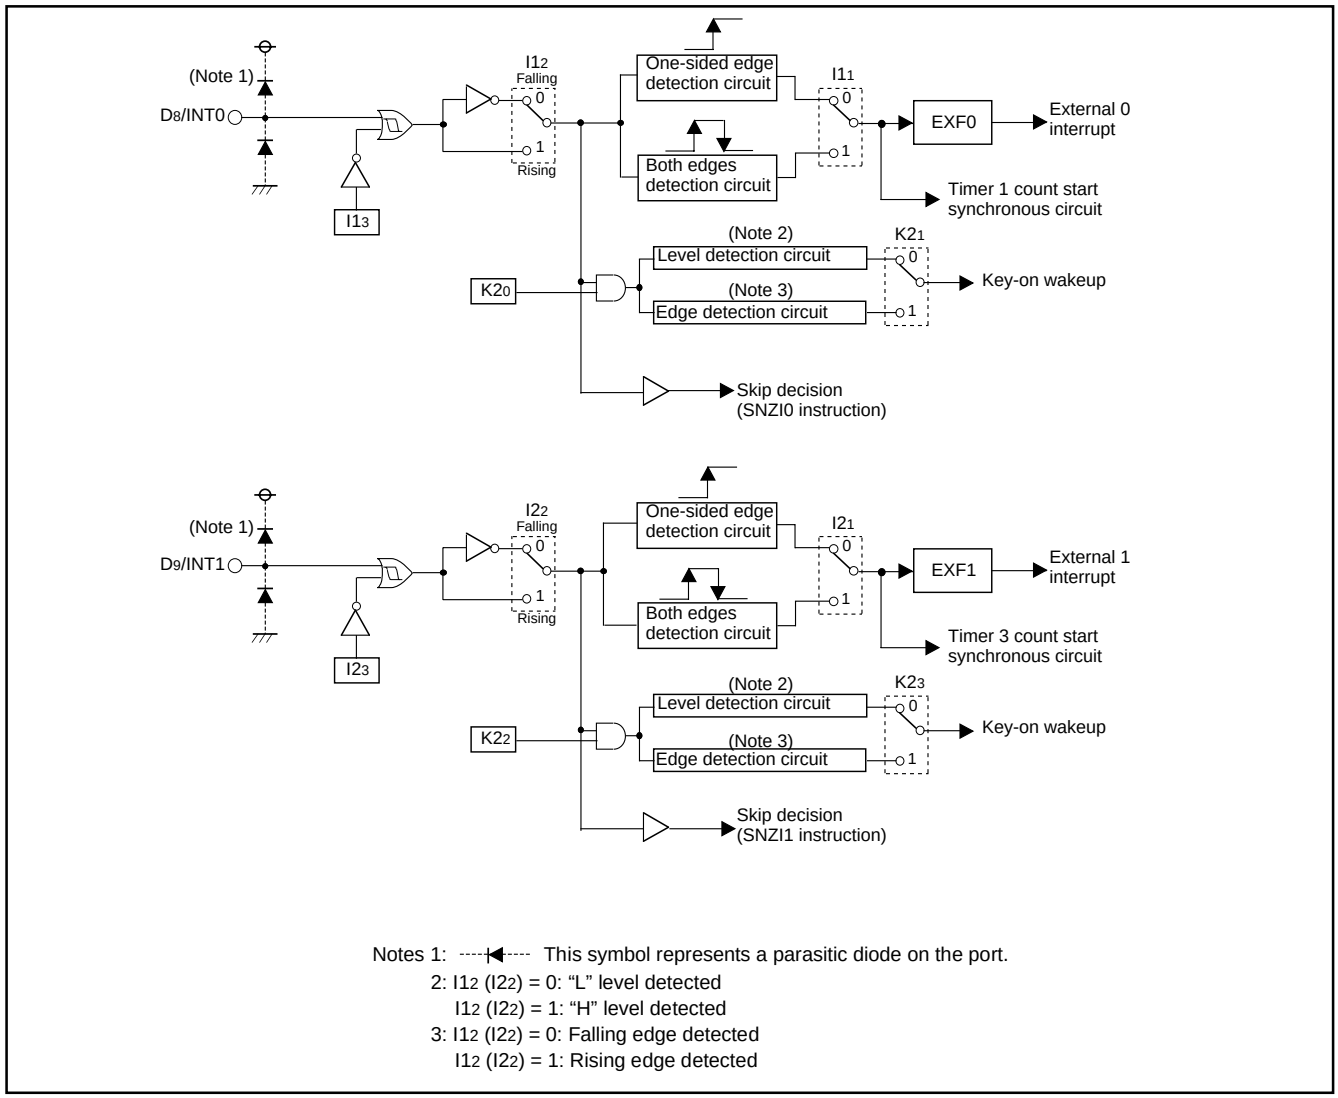
The 4554 Group has the external 0 interrupt and external 1 interrupt.

An external interrupt request occurs when a valid waveform is input to an interrupt input pin (edge detection).

The external interrupt can be controlled with the interrupt control registers I1 and I2.

Table 7 External interrupt activated conditions

Name	Input pin	Activated condition	Valid waveform selection bit
External 0 interrupt	D8/INT0	When the next waveform is input to D8/INT0 pin • Falling waveform (“H”→“L”) • Rising waveform (“L”→“H”) • Both rising and falling waveforms	I11 I12
External 1 interrupt	D9/INT1	When the next waveform is input to D9/INT1 pin • Falling waveform (“H”→“L”) • Rising waveform (“L”→“H”) • Both rising and falling waveforms	I21 I22



Notes 1: ----|◄---- This symbol represents a parasitic diode on the port.
2: I12 (I22) = 0: “L” level detected
I12 (I22) = 1: “H” level detected
3: I12 (I22) = 0: Falling edge detected
I12 (I22) = 1: Rising edge detected

Fig. 17 External interrupt circuit structure

(1) External 0 interrupt request flag (EXF0)

External 0 interrupt request flag (EXF0) is set to “1” when a valid waveform is input to D_8/INT0 pin.

The valid waveforms causing the interrupt must be retained at their level for 4 clock cycles or more of the system clock (Refer to Figure 16).

The state of EXF0 flag can be examined with the skip instruction (SNZ0). Use the interrupt control register V1 to select the interrupt or the skip instruction. The EXF0 flag is cleared to “0” when an interrupt occurs or when the next instruction is skipped with the skip instruction.

• External 0 interrupt activated condition

External 0 interrupt activated condition is satisfied when a valid waveform is input to D_8/INT0 pin.

The valid waveform can be selected from rising waveform, falling waveform or both rising and falling waveforms. An example of how to use the external 0 interrupt is as follows.

① Set the bit 3 of register I1 to “1” for the INT0 pin to be in the input enabled state.
② Select the valid waveform with the bits 1 and 2 of register I1.
③ Clear the EXF0 flag to “0” with the SNZ0 instruction.
④ Set the NOP instruction for the case when a skip is performed with the SNZ0 instruction.
⑤ Set both the external 0 interrupt enable bit ($V1_0$) and the INTE flag to “1.”

The external 0 interrupt is now enabled. Now when a valid waveform is input to the D_8/INT0 pin, the EXF0 flag is set to “1” and the external 0 interrupt occurs.

(2) External 1 interrupt request flag (EXF1)

External 1 interrupt request flag (EXF1) is set to “1” when a valid waveform is input to D_9/INT1 pin.

The valid waveforms causing the interrupt must be retained at their level for 4 clock cycles or more of the system clock (Refer to Figure 16).

The state of EXF1 flag can be examined with the skip instruction (SNZ1). Use the interrupt control register V1 to select the interrupt or the skip instruction. The EXF1 flag is cleared to “0” when an interrupt occurs or when the next instruction is skipped with the skip instruction.

• External 1 interrupt activated condition

External 1 interrupt activated condition is satisfied when a valid waveform is input to D_9/INT1 pin.

The valid waveform can be selected from rising waveform, falling waveform or both rising and falling waveforms. An example of how to use the external 1 interrupt is as follows.

① Set the bit 3 of register I2 to “1” for the INT1 pin to be in the input enabled state.
② Select the valid waveform with the bits 1 and 2 of register I2.
③ Clear the EXF1 flag to “0” with the SNZ1 instruction.
④ Set the NOP instruction for the case when a skip is performed with the SNZ1 instruction.
⑤ Set both the external 1 interrupt enable bit ($V1_1$) and the INTE flag to “1.”

The external 1 interrupt is now enabled. Now when a valid waveform is input to the D_9/INT1 pin, the EXF1 flag is set to “1” and the external 1 interrupt occurs.

(3) External interrupt control registers

• Interrupt control register I1

Register I1 controls the valid waveform for the external 0 interrupt. Set the contents of this register through register A with the TI1A instruction. The TAI1 instruction can be used to transfer the contents of register I1 to register A.

• Interrupt control register I2

Register I2 controls the valid waveform for the external 1 interrupt. Set the contents of this register through register A with the TI2A instruction. The TAI2 instruction can be used to transfer the contents of register I2 to register A.

Table 8 External interrupt control register

Interrupt control register I1		at reset : 0000_2	at power down : state retained	R/W TAI1/TI1A
$I1_3$	INT0 pin input control bit (Note 2)	0	INT0 pin input disabled	
		1	INT0 pin input enabled	
$I1_2$	Interrupt valid waveform for INT0 pin/ return level selection bit (Note 2)	0	Falling waveform/"L" level ("L" level is recognized with the SNZI0 instruction)	
		1	Rising waveform/"H" level ("H" level is recognized with the SNZI0 instruction)	
$I1_1$	INT0 pin edge detection circuit control bit	0	One-sided edge detected	
		1	Both edges detected	
$I1_0$	INT0 pin Timer 1 count start synchronous circuit selection bit	0	Timer 1 count start synchronous circuit not selected	
		1	Timer 1 count start synchronous circuit selected	

Interrupt control register I2		at reset : 0000_2	at power down : state retained	R/W TAI2/TI2A
$I2_3$	INT1 pin input control bit (Note 2)	0	INT1 pin input disabled	
		1	INT1 pin input enabled	
$I2_2$	Interrupt valid waveform for INT1 pin/ return level selection bit (Note 2)	0	Falling waveform/"L" level ("L" level is recognized with the SNZI1 instruction)	
		1	Rising waveform/"H" level ("H" level is recognized with the SNZI1 instruction)	
$I2_1$	INT1 pin edge detection circuit control bit	0	One-sided edge detected	
		1	Both edges detected	
$I2_0$	INT1 pin Timer 3 count start synchronous circuit selection bit	0	Timer 3 count start synchronous circuit not selected	
		1	Timer 3 count start synchronous circuit selected	

Notes 1: "R" represents read enabled, and "W" represents write enabled.

2: When the contents of these bits ($I1_2$, $I1_3$, $I2_2$ and $I2_3$) are changed, the external interrupt request flag (EXF0, EXF1) may be set.

(4) Notes on External 0 interrupts

① Note [1] on bit 3 of register I1

When the input of the INT0 pin is controlled with the bit 3 of register I1 in software, be careful about the following notes.

• Depending on the input state of the D8/INT0 pin, the external 0 interrupt request flag (EXF0) may be set when the bit 3 of register I1 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 0 of register V1 to "0" (refer to Figure 18①) and then, change the bit 3 of register I1.
In addition, execute the SNZ0 instruction to clear the EXF0 flag to "0" after executing at least one instruction (refer to Figure 18②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ0 instruction (refer to Figure 18③).

```
    ⋮

    ⋮
   X : these bits are not used here.
```

Fig. 18 External 0 interrupt program example-1

② Note [2] on bit 3 of register I1

When the bit 3 of register I1 is cleared to "0", the RAM back-up mode is selected and the input of INT0 pin is disabled, be careful about the following notes.

• When the key-on wakeup function of INT0 pin is not used (register $K2_0$ = "0"), clear bits 2 and 3 of register I1 before system enters to the RAM back-up mode. (refer to Figure 19①).

```

    ⋮
   X : these bits are not used here.
```

Fig. 19 External 0 interrupt program example-2

③ Note on bit 2 of register I1

When the interrupt valid waveform of the D8/INT0 pin is changed with the bit 2 of register I1 in software, be careful about the following notes.

• Depending on the input state of the D8/INT0 pin, the external 0 interrupt request flag (EXF0) may be set when the bit 2 of register I1 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 0 of register V1 to "0" (refer to Figure 20①) and then, change the bit 2 of register I1.
In addition, execute the SNZ0 instruction to clear the EXF0 flag to "0" after executing at least one instruction (refer to Figure 20②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ0 instruction (refer to Figure 20③).

```
    ⋮
LA    4        ; (XXX0₂)
TV1A           ; The SNZ0 instruction is valid ..... ①
LA    12       ; (X1XX₂)
TI1A           ; Interrupt valid waveform is changed
NOP            ..... ②
SNZ0           ; The SNZ0 instruction is executed
                 (EXF0 flag cleared)
NOP            ..... ③
    ⋮
   X : these bits are not used here.
```

Fig. 20 External 0 interrupt program example-3

(5) Notes on External 1 interrupts

① Note [1] on bit 3 of register I2

When the input of the INT1 pin is controlled with the bit 3 of register I2 in software, be careful about the following notes.

• Depending on the input state of the D9/INT1 pin, the external 1 interrupt request flag (EXF1) may be set when the bit 3 of register I2 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 1 of register V1 to "0" (refer to Figure 21①) and then, change the bit 3 of register I2.
In addition, execute the SNZ1 instruction to clear the EXF1 flag to "0" after executing at least one instruction (refer to Figure 21②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ1 instruction (refer to Figure 21③).

```
    ⋮
LA     4        ; (XX0X2)
TV1A            ; The SNZ1 instruction is valid ..... ①
LA     8        ; (1XXX2)
TI2A            ; Control of INT1 pin input is changed
NOP             ..... ②
SNZ1            ; The SNZ1 instruction is executed
                  (EXF1 flag cleared)
NOP             ..... ③
    ⋮
```

X : these bits are not used here.

Fig. 21 External 1 interrupt program example-1

② Note [2] on bit 3 of register I2

When the bit 3 of register I2 is cleared to "0", the RAM back-up mode is selected and the input of INT1 pin is disabled, be careful about the following notes.

• When the key-on wakeup function of INT1 pin is not used (register K22 = "0"), clear bits 2 and 3 of register I2 before system enters to the RAM back-up mode. (refer to Figure 22①).

```
    ⋮
LA     0        ; (00XX2)
TI2A            ; Input of INT1 disabled ..... ①
DI
EPOF
POF2            ; RAM back-up
    ⋮
```

X : these bits are not used here.

Fig. 22 External 1 interrupt program example-2

③ Note on bit 2 of register I2

When the interrupt valid waveform of the D9/INT1 pin is changed with the bit 2 of register I2 in software, be careful about the following notes.

• Depending on the input state of the D9/INT1 pin, the external 1 interrupt request flag (EXF1) may be set when the bit 2 of register I2 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 1 of register V1 to "0" (refer to Figure 23①) and then, change the bit 2 of register I2.
In addition, execute the SNZ1 instruction to clear the EXF1 flag to "0" after executing at least one instruction (refer to Figure 23②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ1 instruction (refer to Figure 23③).

```
    ⋮
LA     4        ; (XX0X2)
TV1A            ; The SNZ1 instruction is valid ..... ①
LA     12       ; (X1XX2)
TI2A            ; Interrupt valid waveform is changed
NOP             ..... ②
SNZ1            ; The SNZ1 instruction is executed
                  (EXF1 flag cleared)
NOP             ..... ③
    ⋮
```

X : these bits are not used here.

Fig. 23 External 1 interrupt program example-3

TIMERS

The 4554 Group has the following timers.

- Programmable timer
  The programmable timer has a reload register and enables the frequency dividing ratio to be set. It is decremented from a setting value n. When it underflows (count to n + 1), a timer interrupt request flag is set to “1,” new data is loaded from the reload register, and count continues (auto-reload function).
- Fixed dividing frequency timer
  The fixed dividing frequency timer has the fixed frequency dividing ratio (n). An interrupt request flag is set to “1” after every n count of a count pulse.

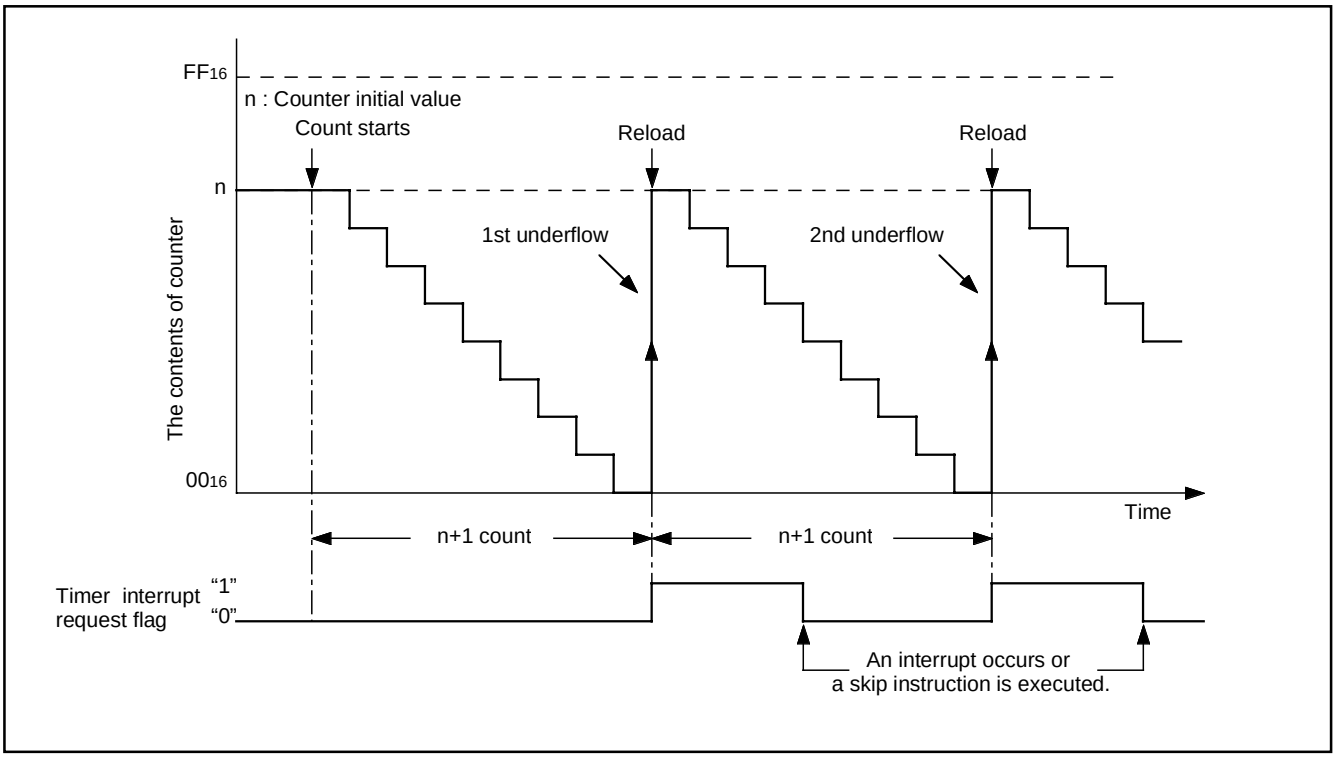

Fig. 24 Auto-reload function

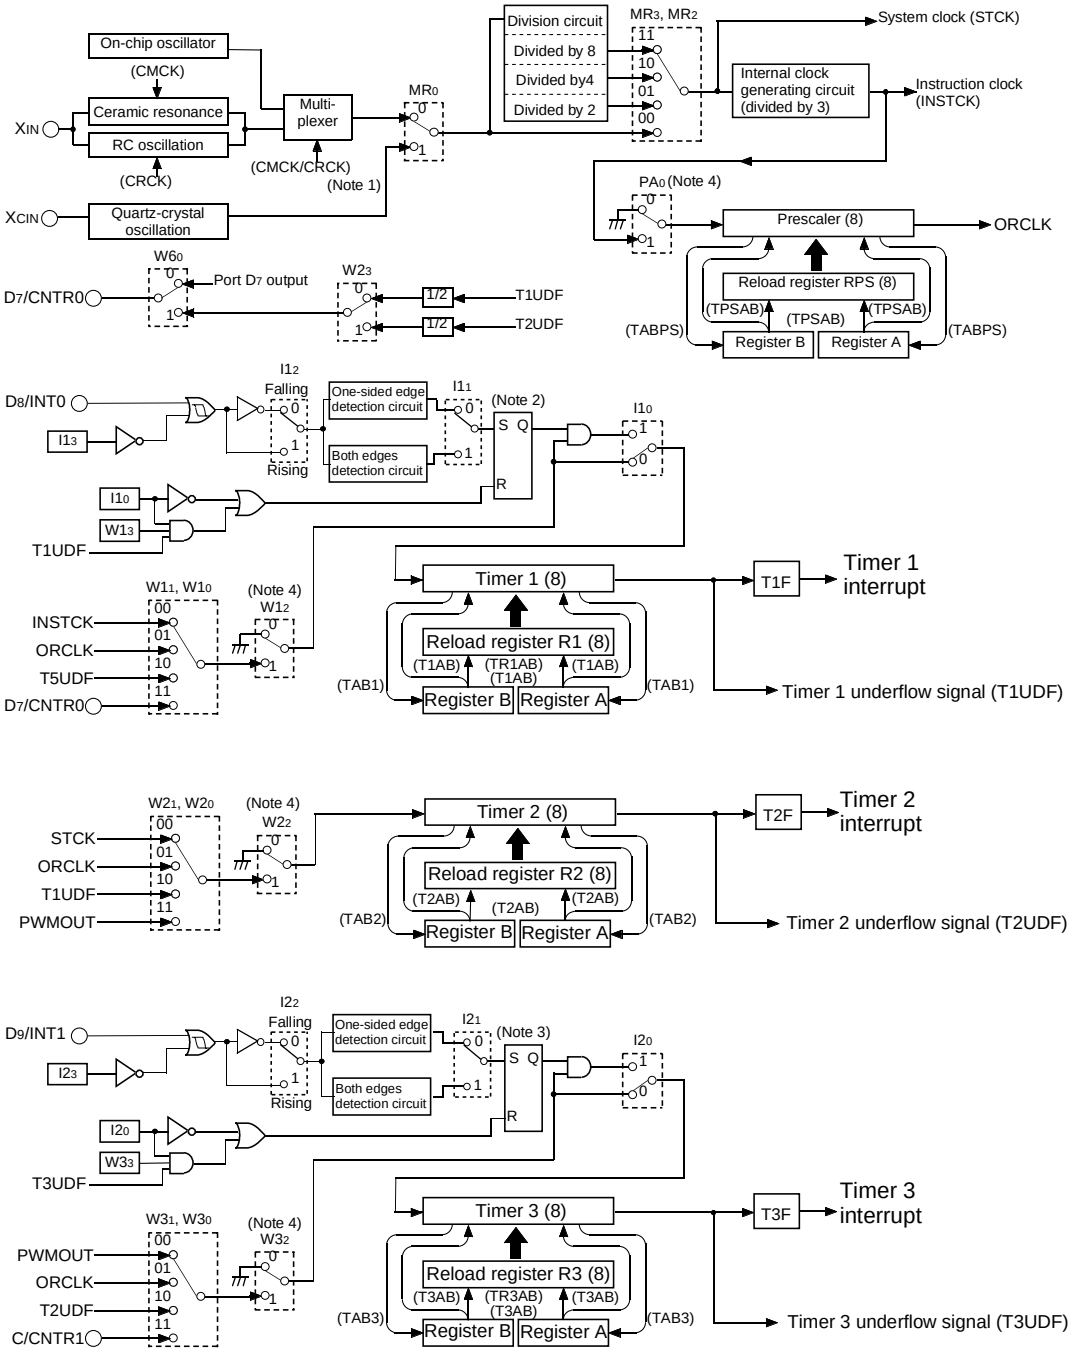
The 4554 Group timer consists of the following circuits.

- Prescaler : 8-bit programmable timer
- Timer 1 : 8-bit programmable timer
- Timer 2 : 8-bit programmable timer
- Timer 3 : 8-bit programmable timer
- Timer 4 : 8-bit programmable timer
- Timer 5 : 16-bit fixed dividing frequency timer
- Timer LC : 4-bit programmable timer
- Watchdog timer : 16-bit fixed dividing frequency timer
  (Timers 1, 2, 3, 4 and 5 have the interrupt function, respectively)

Prescaler and timers 1, 2, 3, 4, 5 and LC can be controlled with the timer control registers PA, W1 to W6. The watchdog timer is a free counter which is not controlled with the control register.
Each function is described below.

Table 9 Function related timers

Circuit	Structure	Count source	Frequency dividing ratio	Use of output signal	Control register
Prescaler	8-bit programmable binary down counter	• Instruction clock (INSTCK)	1 to 256	• Timer 1, 2, 3, 4 and LC count sources	PA
Timer 1	8-bit programmable binary down counter (link to INT0 input)	• Instruction clock (INSTCK) • Prescaler output (ORCLK) • Timer 5 underflow (T5UDF) • CNTR0 input	1 to 256	• Timer 2 count source • CNTR0 output • Timer 1 interrupt	W1 W2
Timer 2	8-bit programmable binary down counter	• System clock (STCK) • Prescaler output (ORCLK) • Timer 1 underflow (T1UDF) • PWM output (PWMOUT)	1 to 256	• Timer 3 count source • CNTR0 output • Timer 2 interrupt	W2
Timer 3	8-bit programmable binary down counter (link to INT1 input)	• PWM output (PWMOUT) • Prescaler output (ORCLK) • Timer 2 underflow (T2UDF) • CNTR1 input	1 to 256	• CNTR1 output control • Timer 3 interrupt	W3
Timer 4	8-bit programmable binary down counter (PWM output function)	• XIN input • Prescaler output (ORCLK)	1 to 256	• Timer 2, 3 count source • CNTR1 output • Timer 4 interrupt	W4
Timer 5	16-bit fixed dividing frequency	• XCIN input	8192 16384 32768 65536	• Timer 1, LC count source • Timer 5 interrupt	W5
Timer LC	4-bit programmable binary down counter	• Bit 4 of timer 5 • Prescaler output (ORCLK)	1 to 16	• LCD clock	W6
Watchdog timer	16-bit fixed dividing frequency	• Instruction clock (INSTCK)	65534	• System reset (count twice) • WDF flag decision	

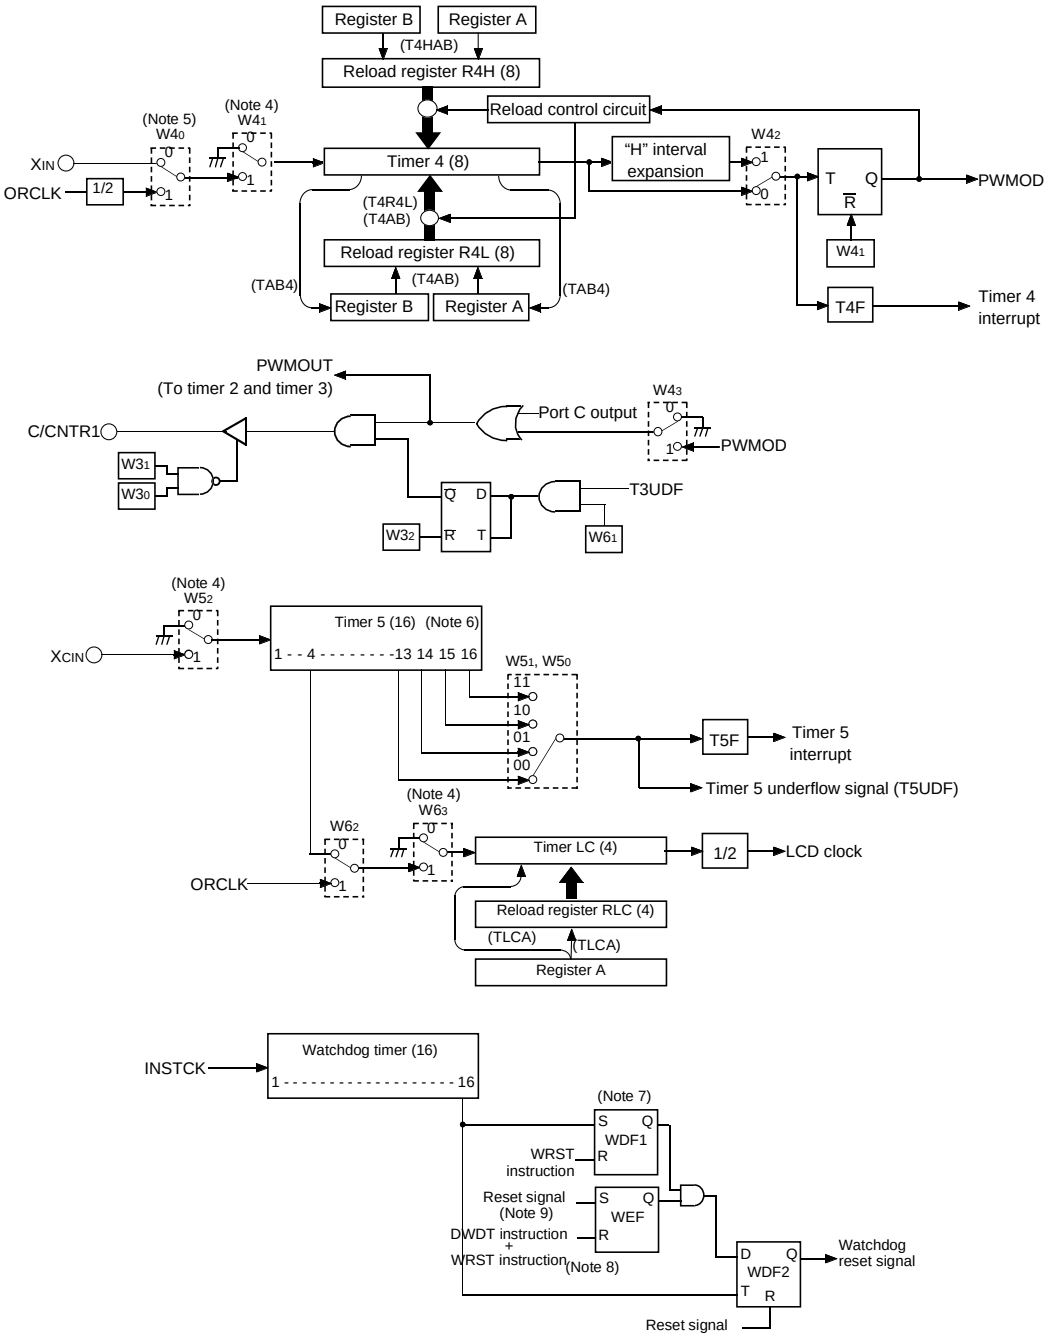


T5UDF: Timer 5 underflow signal (from timer 5)
PWMOUT: PWM output signal (from timer 4 output unit)

Data is set automatically from each reload register when timer underflows (auto-reload function).

Notes 1: When CMCK instruction is executed, ceramic resonance is selected. When CRCK instruction is executed, RC oscillation is selected. When any instructions are not executed, on-chip oscillator clock (internal oscillation) is selected.
2: Timer 1 count start synchronous circuit is set by the valid edge of D8/INT0 pin selected by bits 1 ($I11$) and 2 ($I12$) of register I1.
3: Timer 3 count start synchronous circuit is set by the valid edge of D9/INT1 pin selected by bits 1 ($I21$) and 2 ($I22$) of register I2.
4: Count source is stopped by clearing to "0."

Fig. 25 Timer structure (1)



INSTCK : Instruction clock (system clock divided by 3)
ORCLK : Prescaler output (instruction clock divided by 1 to 256)

Data is set automatically from each reload register when timer underflows (auto-reload function).

Notes 4: Count source is stopped by clearing to "0."
5: XIN cannot be used as count source when bit 1 (MR1) of register MR is set to "1" and f(XIN) oscillation is stopped.
6: This timer is initialized (initial value = FFFF16) by stop of count source (W52 = "0").
7: Flag WDF1 is cleared to "0" and the next instruction is skipped when the WRST instruction is executed while flag WDF1 = "1". The next instruction is not skipped even when the WRST instruction is executed while flag WDF1 = "0".
8: Flag WEF is cleared to "0" and watchdog timer reset does not occur when the DWDT instruction and WRST instruction are executed continuously.
9: The WEF flag is set to "1" at system reset or RAM back-up mode.

Fig. 26 Timer structure (2)

		1	CNTR0 input/output/D_7 (input)	

Notes 1: “R” represents read enabled, and “W” represents write enabled.
2: CNTR0 input is valid only when CNTR0 input is selected for the timer 1 count source.

(1) Timer control registers

- Timer control register PA
  Register PA controls the count operation of prescaler. Set the contents of this register through register A with the TPAA instruction.
- Timer control register W1
  Register W1 controls the selection of timer 1 count auto-stop circuit, and the count operation and count source of timer 1. Set the contents of this register through register A with the TW1A instruction. The TAW1 instruction can be used to transfer the contents of register W1 to register A.
- Timer control register W2
  Register W2 controls the selection of CNTR0 output, and the count operation and count source of timer 2. Set the contents of this register through register A with the TW2A instruction. The TAW2 instruction can be used to transfer the contents of register W2 to register A.
- Timer control register W3
  Register W3 controls the selection of timer 3 count auto-stop circuit, and the count operation and count source of timer 3. Set the contents of this register through register A with the TW3A instruction. The TAW3 instruction can be used to transfer the contents of register W3 to register A.
- Timer control register W4
  Register W4 controls the CNTR1 output, the expansion of "H" interval of PWM output, and the count operation and count source of timer 4. Set the contents of this register through register A with the TW4A instruction. The TAW4 instruction can be used to transfer the contents of register W4 to register A.
- Timer control register W5
  Register W5 controls the count operation and count source of timer 5. Set the contents of this register through register A with the TW5A instruction. The TAW5 instruction can be used to transfer the contents of register W5 to register A.
- Timer control register W6
  Register W6 controls the operation and count source of timer LC, the selection of CNTR1 output auto-control circuit and the D_7/CNTR0 pin function. Set the contents of this register through register A with the TW6A instruction. The TAW6 instruction can be used to transfer the contents of register W6 to register A..

(2) Prescaler (interrupt function)

Prescaler is an 8-bit binary down counter with the prescaler reload register PRS. Data can be set simultaneously in prescaler and the reload register RPS with the TPSAB instruction. Data can be read from reload register RPS with the TABPS instruction.
Stop counting and then execute the TPSAB or TABPS instruction to read or set prescaler data.
Prescaler starts counting after the following process;
① set data in prescaler, and
② set the bit 0 of register PA to "1."
When a value set in reload register RPS is n, prescaler divides the count source signal by n + 1 (n = 0 to 255).
Count source for prescaler is the instruction clock (INSTCK).
Once count is started, when prescaler underflows (the next count pulse is input after the contents of prescaler becomes "0"), new data is loaded from reload register RPS, and count continues (auto-reload function).
The output signal (ORCLK) of prescaler can be used for timer 1, 2, 3, 4 and LC count sources.

(3) Timer 1 (interrupt function)

Timer 1 is an 8-bit binary down counter with the timer 1 reload register (R1). Data can be set simultaneously in timer 1 and the reload register (R1) with the T1AB instruction. Data can be written to reload register (R1) with the TR1AB instruction. Data can be read from timer 1 with the TAB1 instruction.
Stop counting and then execute the T1AB or TAB1 instruction to read or set timer 1 data.
When executing the TR1AB instruction to set data to reload register R1 while timer 1 is operating, avoid a timing when timer 1 underflows.
Timer 1 starts counting after the following process;
① set data in timer 1
② set count source by bits 0 and 1 of register W1, and
③ set the bit 2 of register W1 to "1."

When a value set in reload register R1 is n, timer 1 divides the count source signal by n + 1 (n = 0 to 255).
Once count is started, when timer 1 underflows (the next count pulse is input after the contents of timer 1 becomes "0"), the timer 1 interrupt request flag (T1F) is set to "1," new data is loaded from reload register R1, and count continues (auto-reload function).
INT0 pin input can be used as the start trigger for timer 1 count operation by setting the bit 0 of register I1 to "1."
Also, in this time, the auto-stop function by timer 1 underflow can be performed by setting the bit 3 of register W1 to "1."
Timer 1 underflow signal divided by 2 can be output from CNTR0 pin by clearing bit 3 of register W2 to "0" and setting bit 0 of register W6 to "1".

(4) Timer 2 (interrupt function)

Timer 2 is an 8-bit binary down counter with the timer 2 reload register (R2). Data can be set simultaneously in timer 2 and the reload register (R2) with the T2AB instruction. Data can be read from timer 2 with the TAB2 instruction. Stop counting and then execute the T2AB or TAB2 instruction to read or set timer 2 data.

Timer 2 starts counting after the following process;

① set data in timer 2,

② select the count source with the bits 0 and 1 of register W2, and

③ set the bit 2 of register W2 to "1."

When a value set in reload register R2 is n, timer 2 divides the count source signal by n + 1 (n = 0 to 255).

Once count is started, when timer 2 underflows (the next count pulse is input after the contents of timer 2 becomes "0"), the timer 2 interrupt request flag (T2F) is set to "1," new data is loaded from reload register R2, and count continues (auto-reload function).

Timer 2 underflow signal divided by 2 can be output from CNTR0 pin by setting bit 3 of register W2 to "1" and setting bit 0 of register W6 to "1".

(5) Timer 3 (interrupt function)

Timer 3 is an 8-bit binary down counter with the timer 3 reload register (R3). Data can be set simultaneously in timer 3 and the reload register (R3) with the T3AB instruction. Data can be written to reload register (R3) with the TR3AB instruction. Data can be read from timer 3 with the TAB3 instruction.

Stop counting and then execute the T3AB or TAB3 instruction to read or set timer 3 data.

When executing the TR3AB instruction to set data to reload register R3 while timer 3 is operating, avoid a timing when timer 3 underflows.

Timer 3 starts counting after the following process;

① set data in timer 3

② set count source by bits 0 and 1 of register W3, and

③ set the bit 2 of register W3 to "1."

When a value set in reload register R3 is n, timer 3 divides the count source signal by n + 1 (n = 0 to 255).

Once count is started, when timer 3 underflows (the next count pulse is input after the contents of timer 3 becomes "0"), the timer 3 interrupt request flag (T3F) is set to "1," new data is loaded from reload register R3, and count continues (auto-reload function).

INT1 pin input can be used as the start trigger for timer 3 count operation by setting the bit 0 of register I2 to "1."

Also, in this time, the auto-stop function by timer 3 underflow can be performed by setting the bit 3 of register W3 to "1."

(6) Timer 4 (interrupt function)

Timer 4 is an 8-bit binary down counter with two timer 4 reload registers (R4L, R4H). Data can be set simultaneously in timer 4 and the reload register R4L with the T4AB instruction. Data can be set in the reload register R4H with the T4HAB instruction. The contents of reload register R4L set with the T4AB instruction can be set to timer 4 again with the T4R4L instruction. Data can be read from timer 4 with the TAB4 instruction.

Stop counting and then execute the T4AB or TAB4 instruction to read or set timer 4 data.

When executing the T4HAB instruction to set data to reload register R4H while timer 4 is operating, avoid a timing when timer 4 underflows.

Timer 4 starts counting after the following process;

① set data in timer 4

② set count source by bit 0 of register W4, and

③ set the bit 1 of register W4 to "1."

When a value set in reload register R4L is n, timer 4 divides the count source signal by n + 1 (n = 0 to 255).

Once count is started, when timer 4 underflows (the next count pulse is input after the contents of timer 4 becomes "0"), the timer 4 interrupt request flag (T4F) is set to "1," new data is loaded from reload register R4L, and count continues (auto-reload function).

When bit 3 of register W4 is set to "1", timer 4 reloads data from reload register R4L and R4H alternately each underflow.

Timer 4 generates the PWM signal (PWMOUT) of the "L" interval set as reload register R4L, and the "H" interval set as reload register R4H. The PWM signal (PWMOUT) is output from CNTR1 pin.

When bit 2 of register W4 is set to "1" at this time, the interval (PWM signal "H" interval) set to reload register R4H for the counter of timer 4 is extended for a half period of count source.

In this case, when a value set in reload register R4H is n, timer 4 divides the count source signal by n + 1.5 (n = 1 to 255).

When this function is used, set "1" or more to reload register R4H.

When bit 1 of register W6 is set to "1", the PWM signal output to CNTR1 pin is switched to valid/invalid each timer 3 underflow. However, when timer 3 is stopped (bit 2 of register W3 is cleared to "0"), this function is canceled.

Even when bit 1 of a register W4 is cleared to "0" in the "H" interval of PWM signal, timer 4 does not stop until it next timer 4 underflow. When clearing bit 1 of register W4 to "0" to stop timer 4, avoid a timing when timer 4 underflows.

(7) Timer 5 (interrupt function)

Timer 5 is a 16-bit binary down counter.
Timer 5 starts counting after the following process;
① set count value by bits 0 and 1 of register W5, and
② set the bit 2 of register W5 to "1."
Count source for timer 5 is the sub-clock input (XCIN).
Once count is started, when timer 5 underflows (the set count value is counted), the timer 5 interrupt request flag (T5F) is set to "1," and count continues.
Bit 4 of timer 5 can be used as the timer LC count source for the LCD clock generating.
When bit 2 of register W5 is cleared to "0", timer 5 is initialized to "$FFFF_{16}$" and count is stopped.
Timer 5 can be used as the counter for clock because it can be operated at clock operating mode (POF instruction execution). When timer 5 underflow occurs at clock operating mode, system returns from the power down state.

(8) Timer LC

Timer LC is a 4-bit binary down counter with the timer LC reload register (RLC). Data can be set simultaneously in timer LC and the reload register (RLC) with the TLCA instruction. Data cannot be read from timer LC. Stop counting and then execute the TLCA instruction to set timer LC data.
Timer LC starts counting after the following process;
① set data in timer LC,
② select the count source with the bit 2 of register W6, and
③ set the bit 3 of register W6 to "1."

When a value set in reload register RLC is n, timer LC divides the count source signal by n + 1 (n = 0 to 15).
Once count is started, when timer LC underflows (the next count pulse is input after the contents of timer LC becomes "0"), new data is loaded from reload register RLC, and count continues (auto-reload function).
Timer LC underflow signal divided by 2 can be used for the LCD clock.

(9) Timer input/output pin (D7/CNTR0 pin, C/CNTR1 pin)

CNTR0 pin is used to input the timer 1 count source and output the timer 1 and timer 2 underflow signal divided by 2.
CNTR1 pin is used to input the timer 3 count source and output the PWM signal generated by timer 4. When the PWM signal is output from C/CNTR1 pin, set "0" to the output latch of port C.
The D_7/CNTR0 pin function can be selected by bit 0 of register W6.
The selection of CNTR1 output signal can be controlled by bit 3 of register W4.
When the CNTR0 input is selected for timer 1 count source, timer 1 counts the rising waveform of CNTR0 input.
When the CNTR1 input is selected for timer 3 count source, timer 3 counts the rising waveform of CNTR1 input. Also, when the CNTR1 input is selected, the output of port C is invalid (high-impedance state).

(10) Timer interrupt request flags (T1F, T2F, T3F, T4F, T5F)

Each timer interrupt request flag is set to "1" when each timer underflows. The state of these flags can be examined with the skip instructions (SNZT1, SNZT2, SNZT3, SNZT4, SNZT5).
Use the interrupt control register V1, V2 to select an interrupt or a skip instruction.
An interrupt request flag is cleared to "0" when an interrupt occurs or when the next instruction is skipped with a skip instruction.

(11) Count start synchronization circuit (timer 1, timer 3)

Timer 1 and timer 3 have the count start synchronous circuit which synchronizes the input of INT0 pin and INT1 pin, and can start the timer count operation.

Timer 1 count start synchronous circuit function is selected by setting the bit 0 of register I1 to "1" and the control by INT0 pin input can be performed.

Timer 3 count start synchronous circuit function is selected by setting the bit 0 of register I2 to "1" and the control by INT1 pin input can be performed.

When timer 1 or timer 3 count start synchronous circuit is used, the count start synchronous circuit is set, the count source is input to each timer by inputting valid waveform to INT0 pin or INT1 pin.

The valid waveform of INT0 pin or INT1 pin to set the count start synchronous circuit is the same as the external interrupt activated condition.

Once set, the count start synchronous circuit is cleared by clearing the bit $I1_0$ or $I2_0$ to "0" or reset.

However, when the count auto-stop circuit is selected, the count start synchronous circuit is cleared (auto-stop) at the timer 1 or timer 3 underflow.

(12) Count auto-stop circuit (timer 1, timer 3)

Timer 1 has the count auto-stop circuit which is used to stop timer 1 automatically by the timer 1 underflow when the count start synchronous circuit is used.

The count auto-stop cicuit is valid by setting the bit 3 of register W1 to "1". It is cleared by the timer 1 underflow and the count source to timer 1 is stopped.

This function is valid only when the timer 1 count start synchronous circuit is selected.

Timer 3 has the count auto-stop circuit which is used to stop timer 3 automatically by the timer 3 underflow when the count start synchronous circuit is used.

The count auto-stop cicuit is valid by setting the bit 3 of register W3 to "1". It is cleared by the timer 3 underflow and the count source to timer 3 is stopped.

This function is valid only when the timer 3 count start synchronous circuit is selected.

(13) Precautions

Note the following for the use of timers.

- Prescaler
  Stop counting and then execute the TABPS instruction to read from prescaler data.
  Stop counting and then execute the TPSAB instruction to set prescaler data.

- Timer count source
  Stop timer 1, 2, 3, 4 and LC counting to change its count source.

- Reading the count value
  Stop timer 1, 2, 3 or 4 counting and then execute the data read instruction (TAB1, TAB2, TAB3, TAB4) to read its data.

- Writing to the timer
  Stop timer 1, 2, 3, 4 or LC counting and then execute the data write instruction (T1AB, T2AB, T3AB, T4AB, TLCA) to write its data.

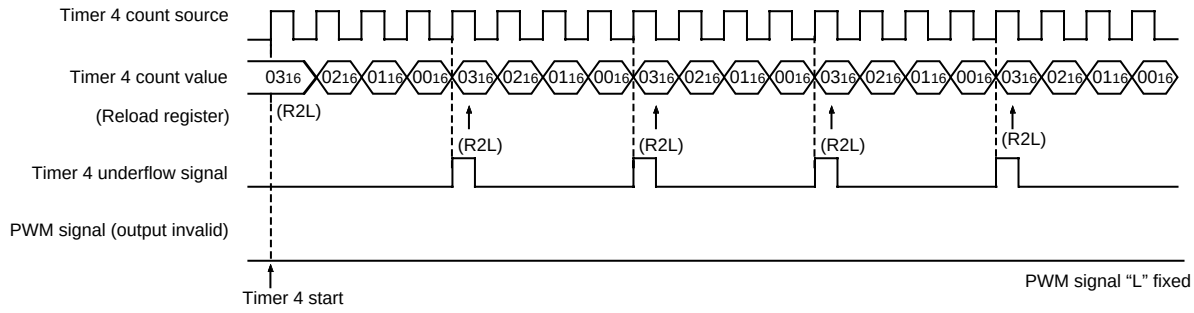
- Writing to reload register R1, R3, R4H
  When writing data to reload register R1, reload register R3 or reload regiser R4H while timer 1, timer 3 or timer 4 is operating, avoid a timing when timer 1, timer 3 or timer 4 underflows.

- Timer 4
  Avoid a timing when timer 4 underflows to stop timer 4.
  When "H" interval extension function of the PWM signal is set to be "valid", set "1" or more to reload register R4H.

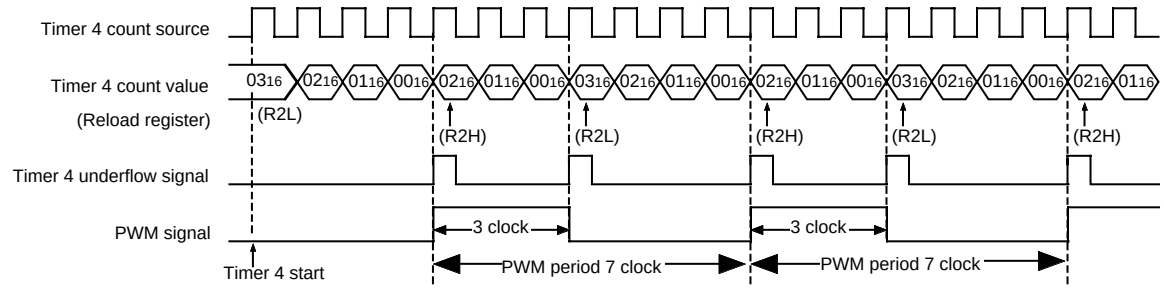
- Timer 5
  Stop timer 5 counting to change its count source.

- Timer input/output pin
  Set the port C output latch to "0" to output the PWM signal from C/CNTR pin.

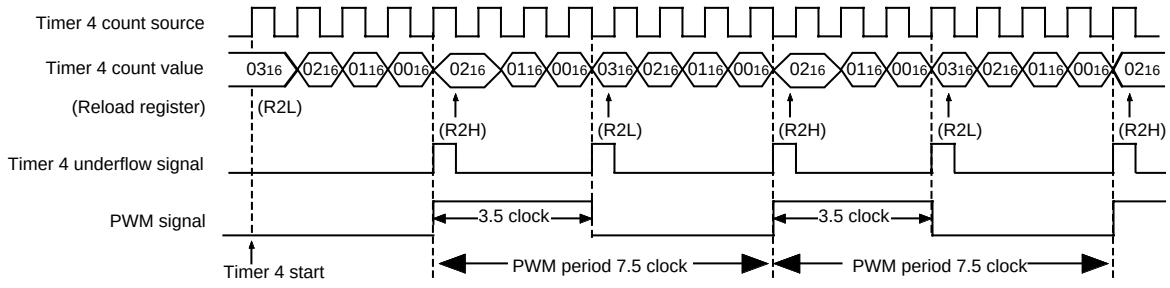
● CNTR1 output: invalid (W4$_3$ = "0")



● CNTR1 output: valid (W4$_3$ = "1")
PWM signal "H" interval extension function: invalid (W4$_2$ = "0")



● CNTR1 output: valid (W4$_3$ = "1")
PWM signal "H" interval extension function: valid (W4$_2$ = "1") (Note)

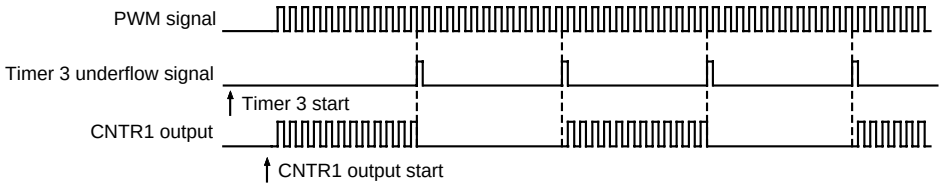


Note: At PWM signal "H" interval extension function: valid, set "01$_{16}$" or more to reload register R4H.

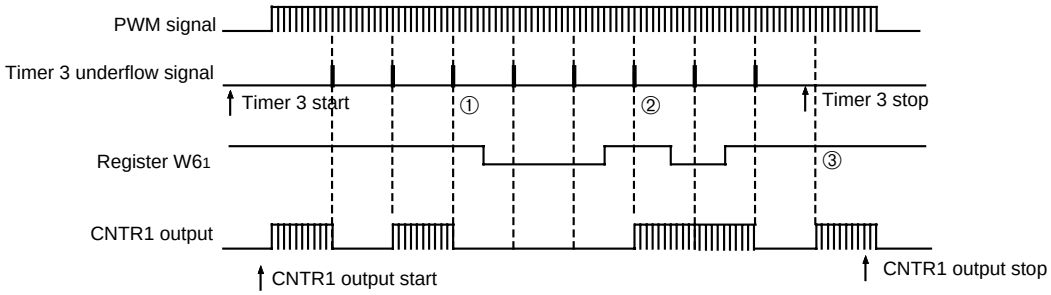
Fig. 27 Timer 4 operation (reload register R4L: "03$_{16}$", R4H: "02$_{16}$")

CNTR1 output auto-control circuit by timer 3 is selected.

● CNTR1 output: valid ($W4_3$ = "1")
CNTR1 output auto-control circuit selected ($W6_1$ = "1")



● CNTR1 output auto-control function

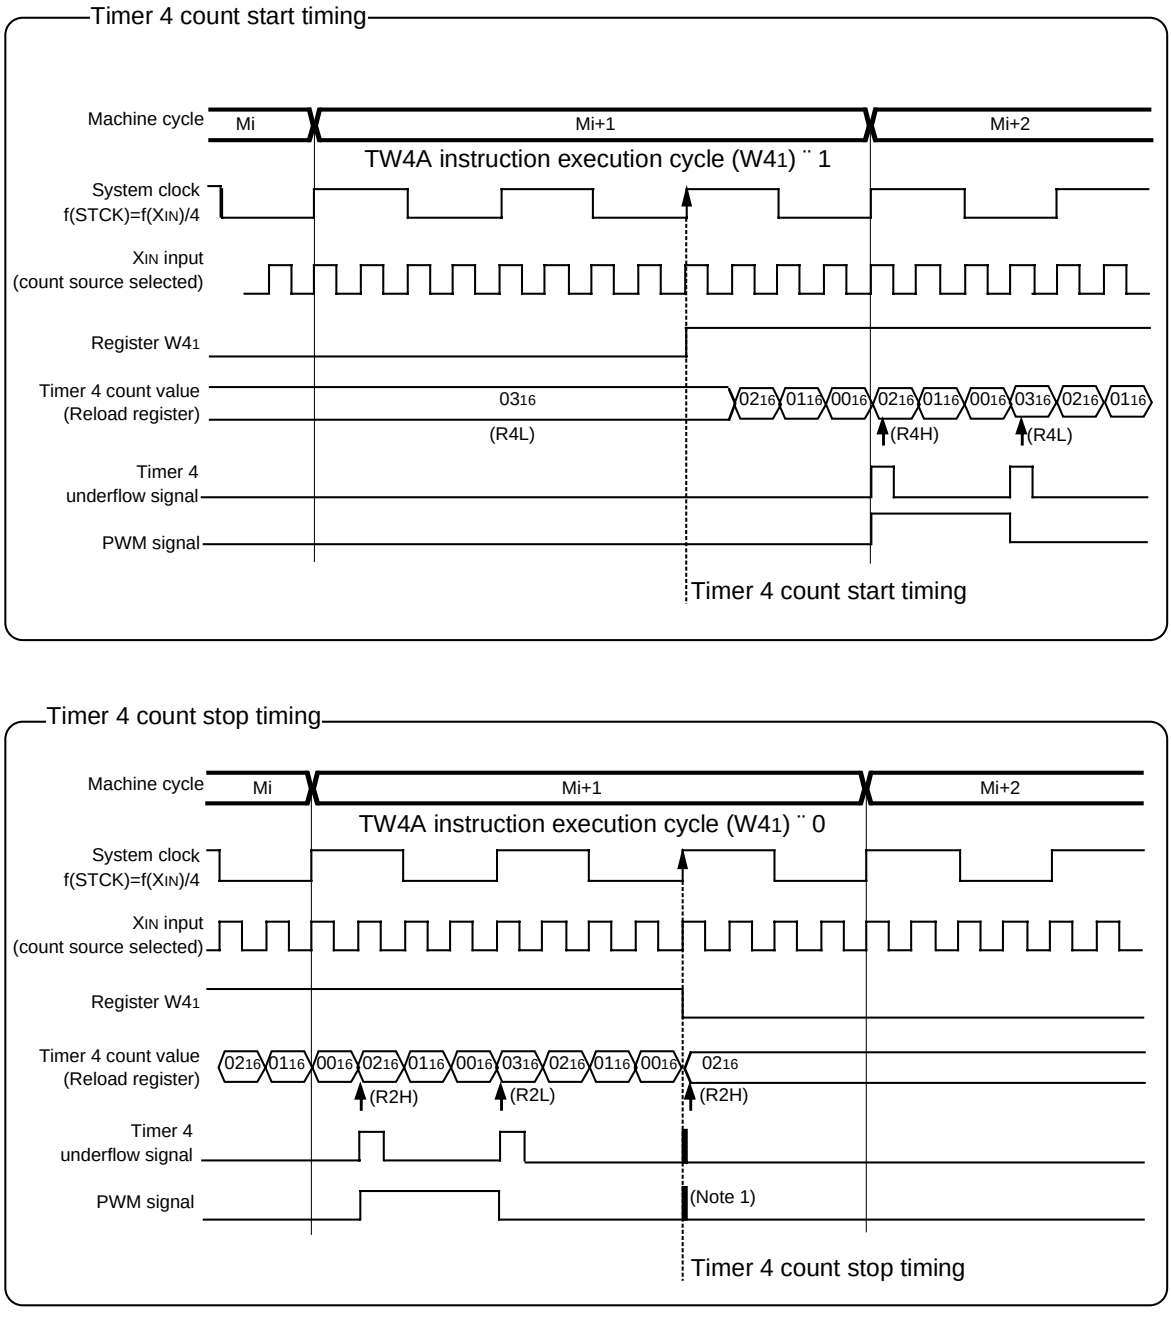


① When the CNTR1 output auto-control function is set to be invalid while the CNTR1 output is invalid, the CNTR1 output invalid state is retained.
② When the CNTR1 output auto-control function is set to be invalid while the CNTR1 output is valid, the CNTR1 output valid state is retained.
③ When timer 3 is stopped, the CNTR1 output auto-control function becomes invalid.

Note: When the PWM signal is output from C/CNTR1 pin, set the output latch of port C to "0".

Fig. 28 CNTR1 output auto-control function by timer 3

●Waveform extension function of CNTR1 output “H” interval: Invalid (W42 = “0”),
CNTR1 output: valid (W43 = “1”),
Count source: XIN input selected (W40 = “0”),
Reload register R4L: “0316”
Reload register R4H: “0216”



Notes 1: In order to stop timer 4 at CNTR1 output valid (W43 = “1”), avoid a timing when timer 4 underflows.
If these timings overlap, a hazard may occur in a CNTR1 output waveform.
2: At CNTR1 output valid, timer 4 stops after “H” interval of PWM signal set by reload register R4H is output.

Fig. 29 Timer 4 count start/stop timing

WATCHDOG TIMER

Watchdog timer provides a method to reset the system when a program run-away occurs. Watchdog timer consists of timer WDT(16-bit binary counter), watchdog timer enable flag (WEF), and watchdog timer flags (WDF1, WDF2).

The timer WDT downcounts the instruction clocks as the count source from "FFFF16" after system is released from reset.

After the count is started, when the timer WDT underflow occurs (after the count value of timer WDT reaches "000016," the next count pulse is input), the WDF1 flag is set to "1."

If the WRST instruction is never executed until the timer WDT underflow occurs (until timer WDT counts 65534), WDF2 flag is set to "1," and the $\overline{\text{RESET}}$ pin outputs "L" level to reset the microcomputer.

Execute the WRST instruction at each period of 65534 machine cycle or less by software when using watchdog timer to keep the microcomputer operating normally.

When the WEF flag is set to "1" after system is released from reset, the watchdog timer function is valid.

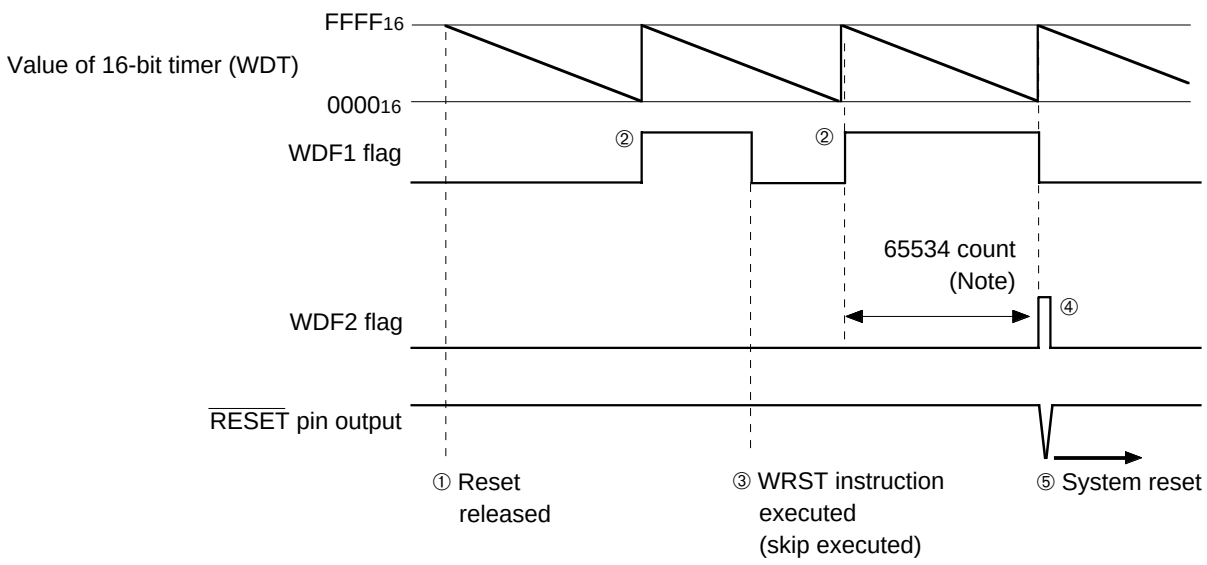
When the DWDT instruction and the WRST instruction are executed continuously, the WEF flag is cleared to "0" and the watchdog timer function is invalid.

The WEF flag is set to "1" at system reset or RAM back-up mode.

The WRST instruction has the skip function. When the WRST instruction is executed while the WDF1 flag is "1", the WDF1 flag is cleared to "0" and the next instruction is skipped.

When the WRST instruction is executed while the WDF1 flag is "0", the next instruction is not skipped.

The skip function of the WRST instruction can be used even when the watchdog timer function is invalid.



① After system is released from reset (= after program is started), timer WDT starts count down.
② When timer WDT underflow occurs, WDF1 flag is set to "1."
③ When the WRST instruction is executed, WDF1 flag is cleared to "0," the next instruction is skipped.
④ When timer WDT underflow occurs while WDF1 flag is "1," WDF2 flag is set to "1" and the watchdog reset signal is output.
⑤ The output transistor of $\overline{\text{RESET}}$ pin is turned "ON" by the watchdog reset signal and system reset is executed.

Note: The number of count is equal to the number of cycle because the count source of watchdog timer is the instruction clock.

Fig. 30 Watchdog timer function

When the watchdog timer is used, clear the WDF1 flag at the period of 65534 machine cycles or less with the WRST instruction.
When the watchdog timer is not used, execute the DWDT instruction and the WRST instruction continuously (refer to Figure 31).
The watchdog timer is not stopped with only the DWDT instruction.
The contents of WDF1 flag and timer WDT are initialized at the power down mode.
When using the watchdog timer and the power down mode, initialize the WDF1 flag with the WRST instruction just before the microcomputer enters the power down state (refer to Figure 32).
The watchdog timer function is valid after system is returned from the power down. When not using the watchdog timer function, execute the DWDT instruction and the WRST instruction continuously every system is returned from the power down, and stop the watchdog timer function.

LCD FUNCTION

The 4554 Group has an LCD (Liquid Crystal Display) controller/driver. When the proper voltage is applied to LCD power supply input pins (V_{LC1}–V_{LC3}) and data are set in timer control register (W6), timer LC, LCD control registers (L1, L2), and LCD RAM, the LCD controller/driver automatically reads the display data and controls the LCD display by setting duty and bias.

4 common signal output pins and 32 segment signal output pins can be used to drive the LCD. By using these pins, up to 128 segments (when 1/4 duty and 1/3 bias are selected) can be controlled to display. The LCD power input pins (V_{LC1}–V_{LC3}) are also used as pins SEG_0–SEG_2. When SEG_0–SEG_2 are selected, the internal power (V_{DD}) is used for the LCD power.

(1) Duty and bias

There are 3 combinations of duty and bias for displaying data on the LCD. Use bits 0 and 1 of LCD control register (L1) to select the proper display method for the LCD panel being used.

- 1/2 duty, 1/2 bias
- 1/3 duty, 1/3 bias
- 1/4 duty, 1/3 bias

Table 11 Duty and maximum number of displayed pixels

Duty	Maximum number of displayed pixels	Used COM pins
1/2	64 segments	COM_0, COM_1 (Note)
1/3	96 segments	COM_0–COM_2 (Note)
1/4	128 segments	COM_0–COM_3

Note: Leave unused COM pins open.

(2) LCD clock control

The LCD clock is determined by the timer LC count source selection bit ($W6_2$), timer LC control bit ($W6_3$), and timer LC. Accordingly, the frequency (F) of the LCD clock is obtained by the following formula. Numbers (① to ③) shown below the formula correspond to numbers in Figure 33, respectively.

- When using the prescaler output (ORCLK) as timer LC count source ($W6_2$="1")

$$F = ORCLK \times \underset{①}{\frac{1}{LC+1}} \times \underset{②}{\frac{1}{2}} \quad ③$$

- When using the bit 4 of timer 5 as timer LC count source ($W6_2$="0")

$$F = \underset{①}{T5_4} \times \underset{②}{\frac{1}{LC+1}} \times \underset{③}{\frac{1}{2}}$$

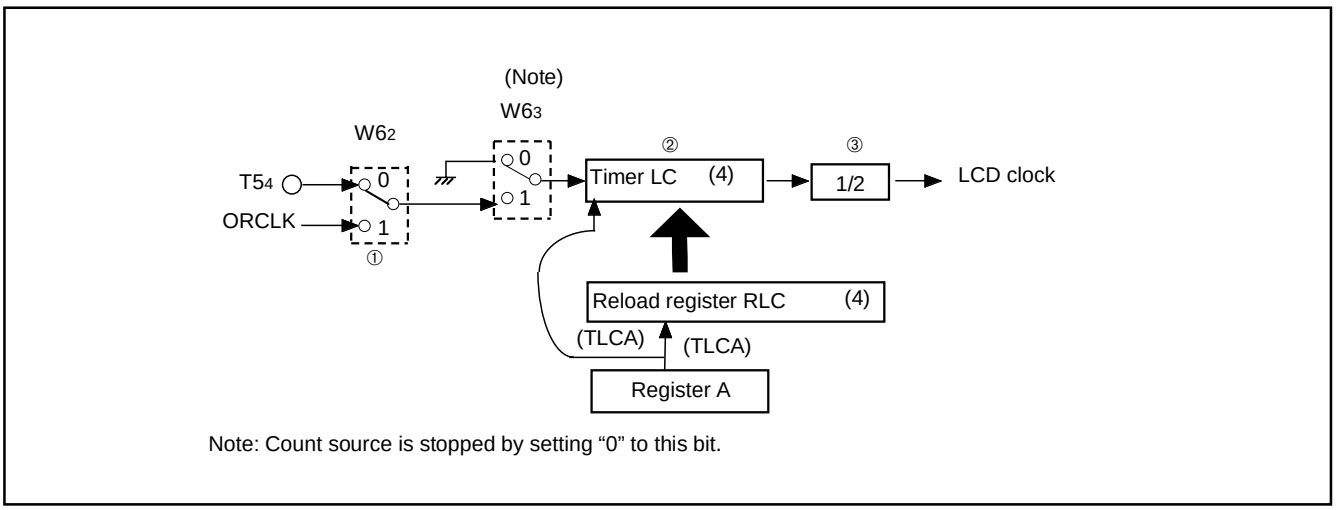
[LC: 0 to 15]

The frame frequency and frame period for each display method can be obtained by the following formula:

$$\text{Frame frequency} = \frac{F}{n} \text{ (Hz)}$$

$$\text{Frame period} = \frac{n}{F} \text{ (s)}$$

[F: LCD clock frequency
1/n: Duty]



Note: Count source is stopped by setting "0" to this bit.

Fig. 33 LCD clock control circuit structure

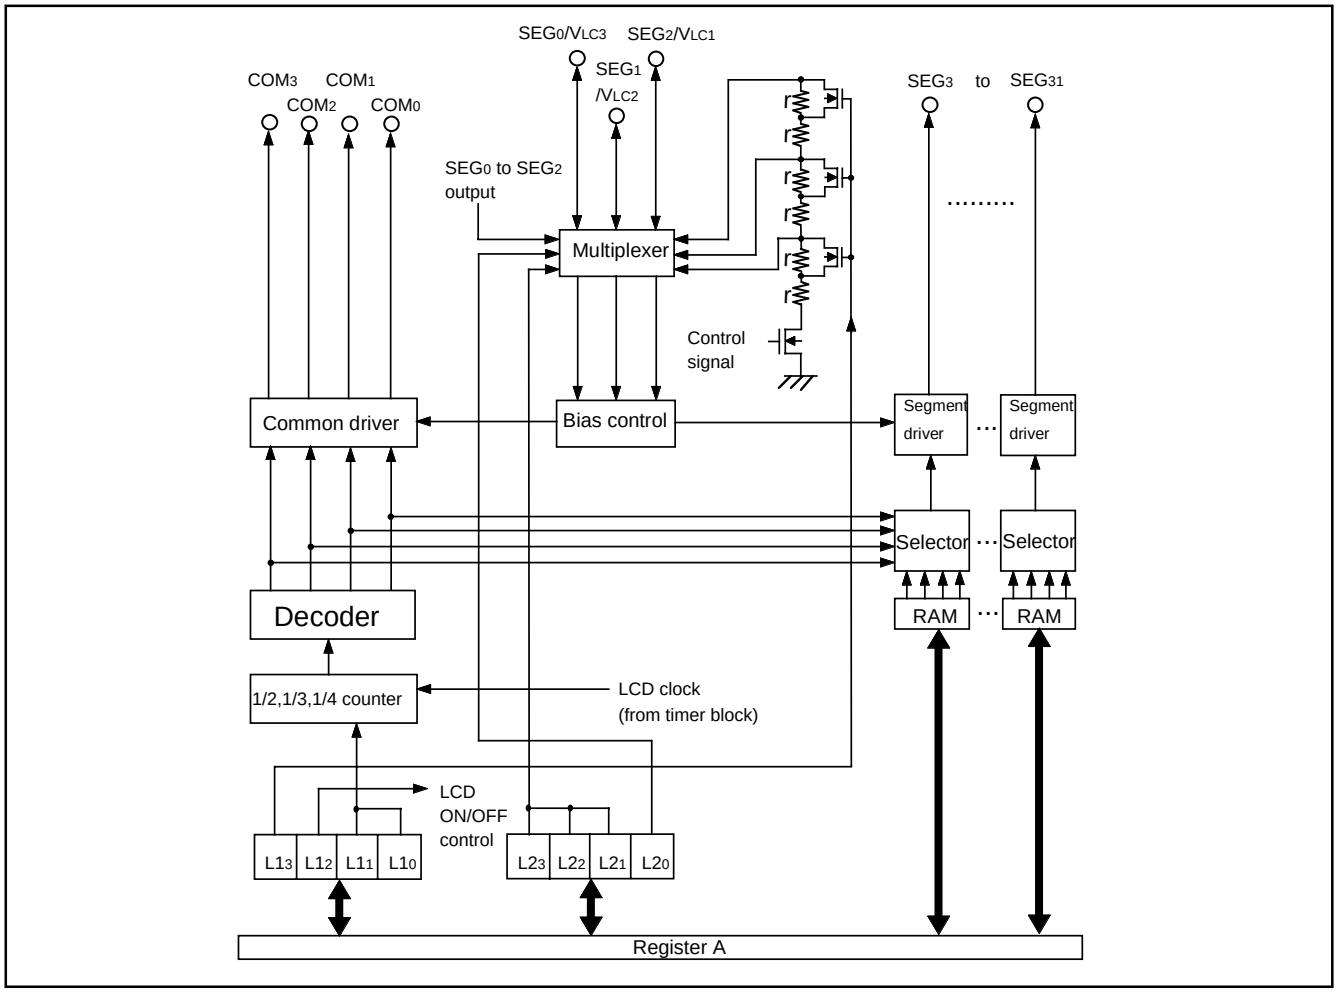


Fig. 34 LCD controller/driver

(3) LCD RAM

RAM contains areas corresponding to the liquid crystal display. When "1" is written to this LCD RAM, the display pixel corresponding to the bit is automatically displayed.

(4) LCD drive waveform

When "1" is written to a bit in the LCD RAM data, the voltage difference between common pin and segment pin which correspond to the bit automatically becomes |V_{LC3}| and the display pixel at the cross section turns on.

When returning from reset, and in the RAM back-up mode, a display pixel turns off because every segment output pin and common output pin becomes V_{LC3} level.

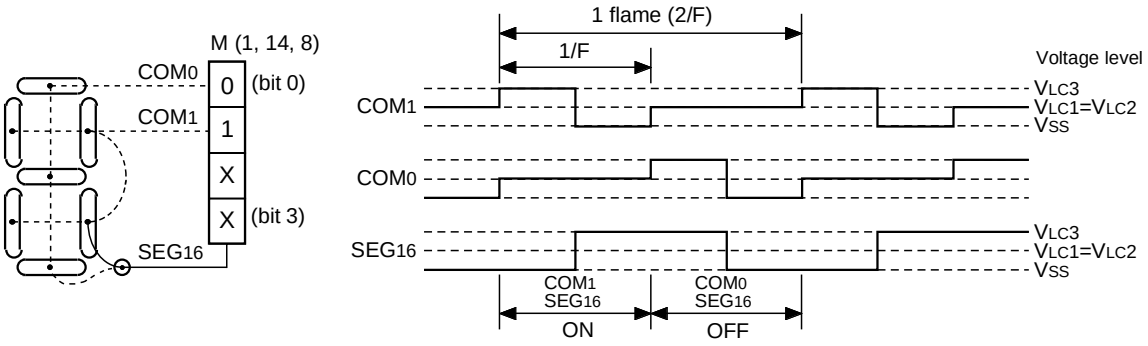
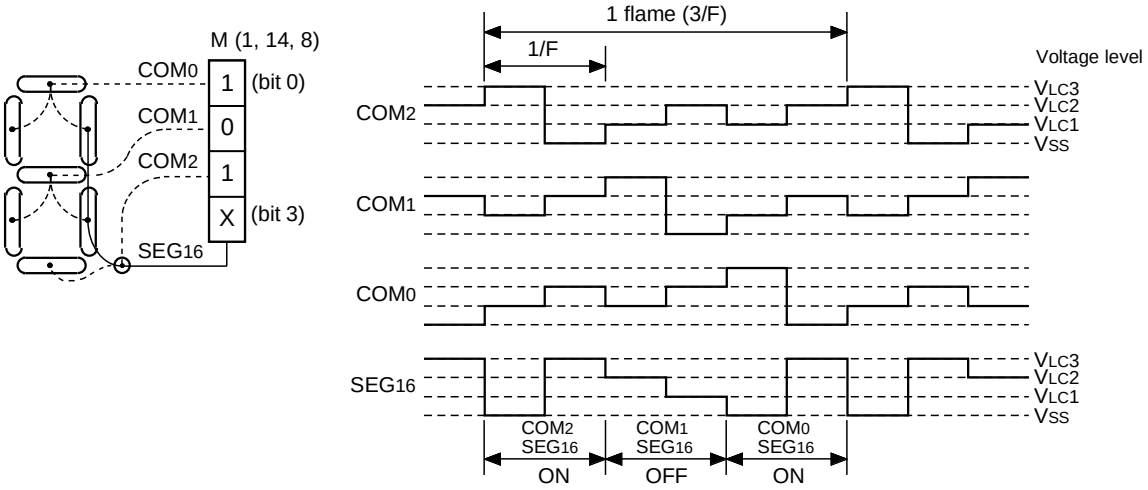
		1		$P2_0$	

Notes 1: "R" represents read enabled, and "W" represents write enabled.
2: "r (resistor) multiplied by 3" is used at 1/3 bias, and "r multiplied by 2" is used at 1/2 bias.
3: V_{LC3} is connected to V_{DD} internally when SEG_0 pin is selected.
4: Use internal dividing resistor when SEG_1 and SEG_2 pins are selected.

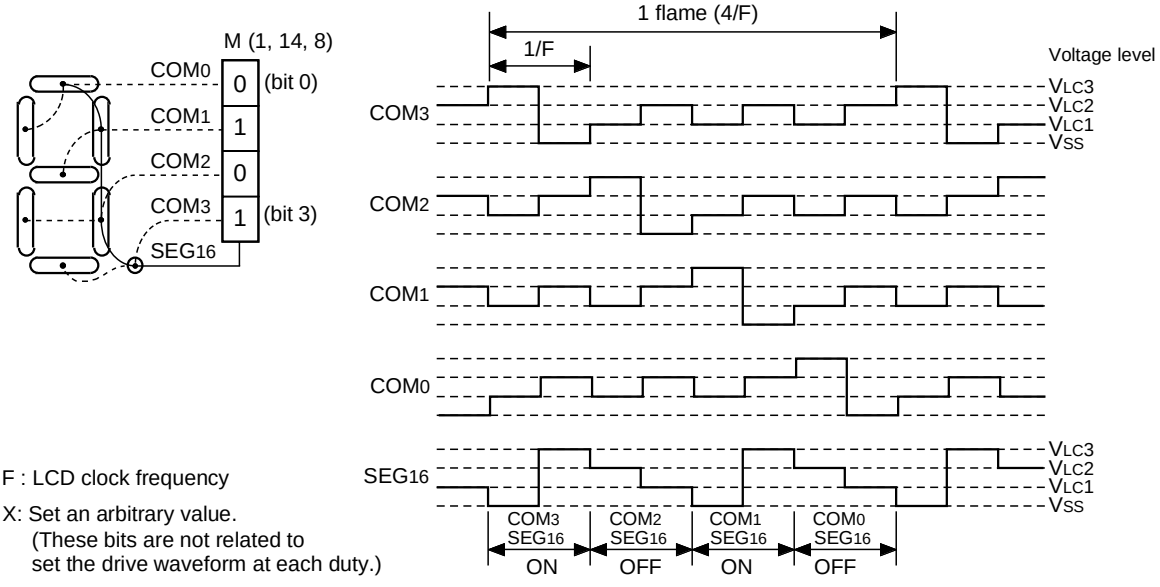
1/2 Duty, 1/2 Bias: When writing $(XX10)_2$ to address M (1, 14, 8) in RAM.



1/3 Duty, 1/3 Bias: When writing $(X101)_2$ to address M (1, 14, 8) in RAM.



1/4 Duty, 1/3 Bias: When writing $(1010)_2$ to address M (1, 14, 8) in RAM.



F : LCD clock frequency

X: Set an arbitrary value.
(These bits are not related to set the drive waveform at each duty.)

Fig. 36 LCD controller/driver structure

(5) LCD power supply circuit

- Internal dividing resistor

  The 4554 Group has the internal dividing resistor for LCD power supply.

  When bit 0 of register L2 is set to “0”, the internal dividing resistor is valid. However, when the LCD is turned off by setting bit 2 of register L1 to “0”, the internal dividing resistor is turned off.

  The same six resistor (r) is prepared for the internal dividing resistor. According to the setting value of bit 3 of register L1 and using bias condition, the resistor is prepared as follows;

  - $L1_3$ = “0”, 1/3 bias used: 2r × 3 = 6r
  - $L1_3$ = “0”, 1/2 bias used: 2r × 2 = 4r
  - $L1_3$ = “1”, 1/3 bias used: r × 3 = 3r
  - $L1_3$ = “1”, 1/2 bias used: r × 2 = 2r

- V_{LC3}/SEG_0 pin

  The selection of V_{LC3}/SEG_0 pin function is controlled with the bit 3 of register L2.

  When the V_{LC3} pin function is selected, apply voltage of $V_{LC3} < V_{DD}$ to the pin externally.

  When the SEG_0 pin function is selected, V_{LC3} is connected to V_{DD} internally.

- V_{LC2}/SEG_1, V_{LC1}/SEG_2 pin

  The selection of V_{LC2}/SEG_1 pin function is controlled with the bit 2 of register L2.

  The selection of V_{LC1}/SEG_2 pin function is controlled with the bit 1 of register L2.

  When the V_{LC2} pin and V_{LC1} pin functions are selected and the internal dividing resistor is not used, apply voltage of $0<V_{LC1}<V_{LC2}<V_{LC3}$ to these pins. Short the V_{LC2} pin and V_{LC1} pin at 1/2 bias.

  When the V_{LC2} pin and V_{LC1} pin functions are selected and the internal dividing resistor is used, the dividing voltage value generated internally is output from the V_{LC1} pin and V_{LC2} pin. The V_{LC2} pin and V_{LC1} pin has the same electric potential at 1/2 bias.

  When SEG_1 and SEG_2 pin function is selected, use the internal dividing resistor. In this time, V_{LC2} and V_{LC1} are connected to the generated dividingg voltage.

RESET FUNCTION

System reset is performed by applying “L” level to $\overline{\text{RESET}}$ pin for 1 machine cycle or more when the following condition is satisfied; the value of supply voltage is the minimum value or more of the recommended operating conditions.
Then when “H” level is applied to $\overline{\text{RESET}}$ pin, software starts from address 0 in page 0.

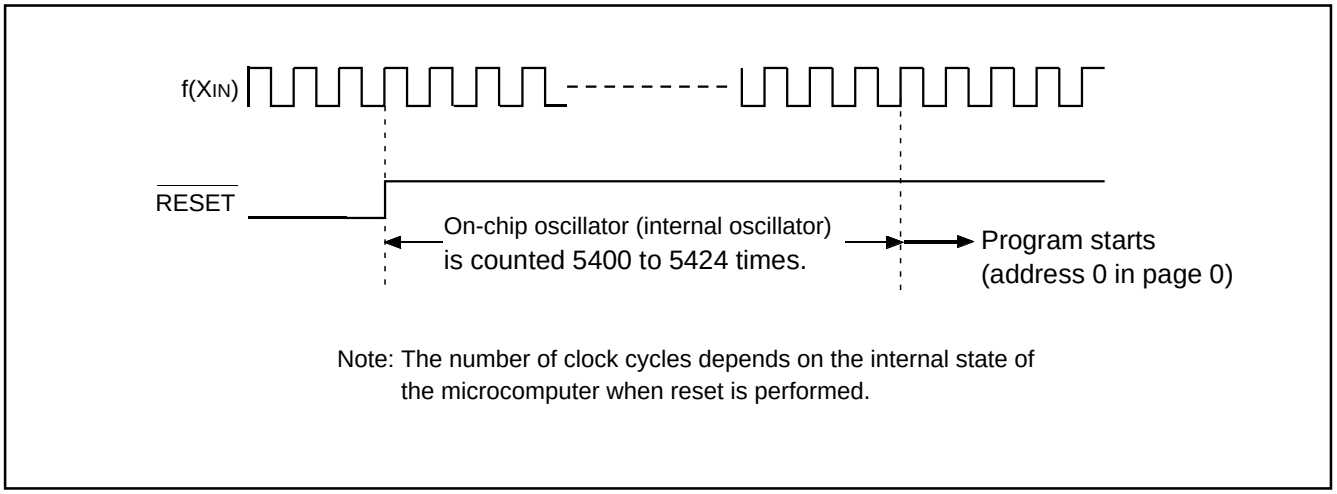


Fig. 37 Reset release timing

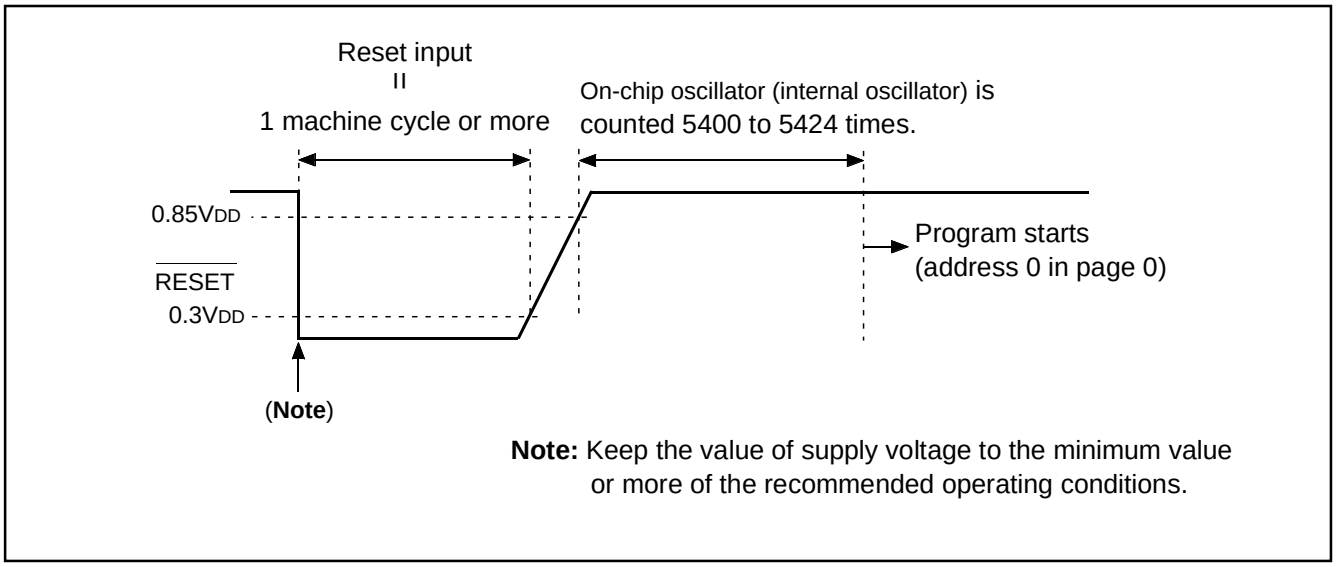

Fig. 38 $\overline{\text{RESET}}$ pin input waveform and reset operation

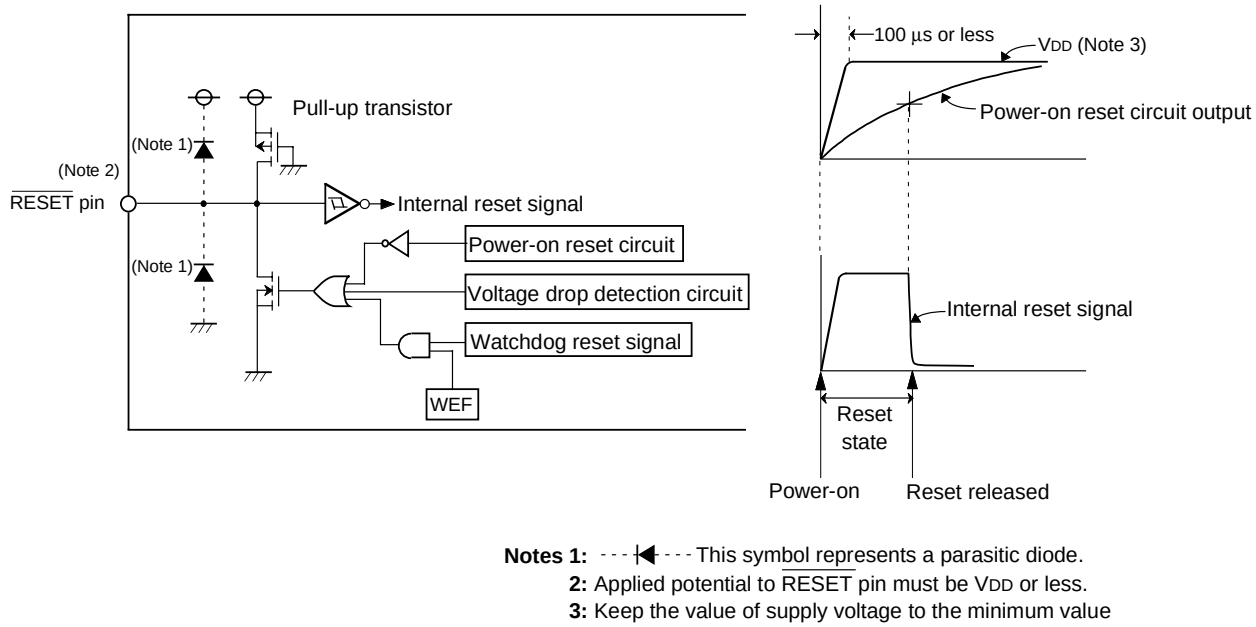
(1) Power-on reset

Reset can be automatically performed at power on (power-on reset) by the built-in power-on reset circuit. When the built-in power-on reset circuit is used, the time for the supply voltage to rise from 0 V must be set to 100 µs or less. If the rising time exceeds 100 µs, connect a capacitor between the $\overline{\text{RESET}}$ pin and V_{SS} at the shortest distance, and input "L" level to $\overline{\text{RESET}}$ pin until the value of supply voltage reaches the minimum operating voltage.



Notes 1: ----|◀---- This symbol represents a parasitic diode.
2: Applied potential to $\overline{\text{RESET}}$ pin must be V_{DD} or less.
3: Keep the value of supply voltage to the minimum value or more of the recommended operating conditions.

Fig. 39 Structure of reset pin and its peripherals,, and power-on reset operation

Table 13 Port state at reset

Name	Function	State
D_0–D_6	D_0–D_6	High-impedance (Notes 1, 2)
D_7/CNTR0	D_7	High-impedance (Notes 1, 2)
D_8/INT0, D_9/INT1	D_8, D_9	High-impedance (Note 1)
$P0_0$–$P0_3$	$P0_0$–$P0_3$	High-impedance (Notes 1, 2, 3)
$P1_0$–$P1_3$	$P1_0$–$P1_3$	High-impedance (Notes 1, 2, 3)
SEG_{31}/$P2_0$–SEG_{28}/$P2_3$	SEG_{31}–SEG_{28}	V_{LC3} (V_{DD}) level
SEG_{27}/$P3_0$–SEG_{24}/$P3_3$	SEG_{27}–SEG_{24}	V_{LC3} (V_{DD}) level
SEG_0/V_{LC3}–SEG_2/V_{LC1}	SEG_0–SEG_2	V_{LC3} (V_{DD}) level
SEG_3–SEG_{23}	SEG_3–SEG_{23}	V_{LC3} (V_{DD}) level
COM_0–COM_3	COM_0–COM_3	V_{LC3} (V_{DD}) level
C/CNTR1	C	"L" (V_{SS}) level

Notes 1: Output latch is set to "1."
2: Output structure is N-channel open-drain.
3: Pull-up transistor is turned OFF.

(2) Internal state at reset

Figure 40 shows internal state at reset (they are the same after system is released from reset). The contents of timers, registers, flags and RAM except shown in Figure 40 are undefined, so set the initial value to them.

- Program counter (PC) 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
  Address 0 in page 0 is set to program counter.
- Interrupt enable flag (INTE) ..... 0 (Interrupt disabled)
- Power down flag (P) 0
- External 0 interrupt request flag (EXF0) 0
- External 1 interrupt request flag (EXF1) 0
- Interrupt control register V1 ..... 0 0 0 0 (Interrupt disabled)
- Interrupt control register V2 ..... 0 0 0 0 (Interrupt disabled)
- Interrupt control register I1 ..... 0 0 0 0
- Interrupt control register I2 ..... 0 0 0 0
- Timer 1 interrupt request flag (T1F) 0
- Timer 2 interrupt request flag (T2F) 0
- Timer 3 interrupt request flag (T3F) 0
- Timer 4 interrupt request flag (T4F) 0
- Timer 5 interrupt request flag (T5F) 0
- Watchdog timer flags (WDF1, WDF2) 0

- RC oscillation circuit ..... Stop
- Quartz-crystal oscillator ..... Operating

"X" represents undefined.

Fig. 40 Internal state at reset

VOLTAGE DROP DETECTION CIRCUIT

The built-in voltage drop detection circuit is designed to detect a drop in voltage and to reset the microcomputer if the supply voltage drops below a set value.

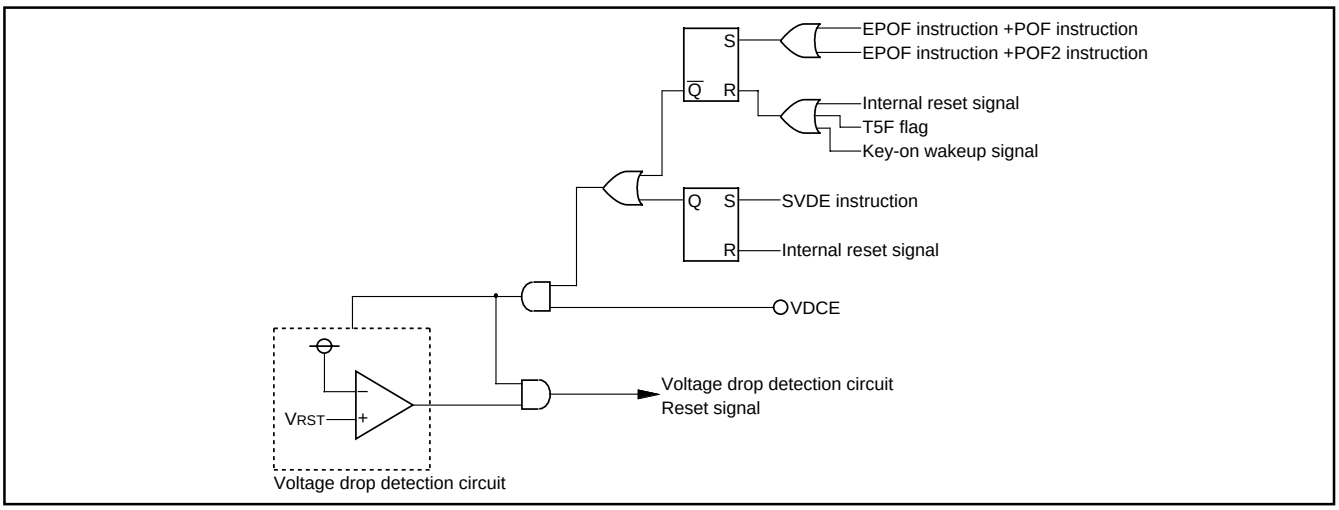

Fig. 41 Voltage drop detection reset circuit

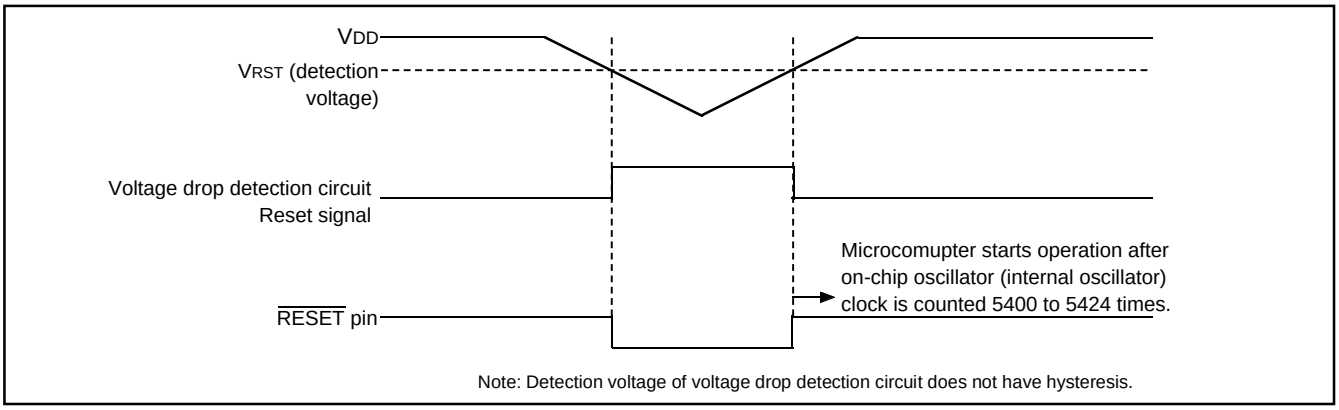

Fig. 42 Voltage drop detection circuit operation waveform

Table 14 Voltage drop detection circuit operation state

VDCE pin	At CPU operating	At power down (SVDE instruction is not executed)	At power down (SVDE instruction is executed)
"L"	Invalid	Invalid	Invalid
"H"	Valid	Invalid	Valid

(2) Note on voltage drop detection circuit

The voltage drop detection circuit detection voltage of this product is set up lower than the minimum value of the supply voltage of the recommended operating conditions.

When the supply voltage of a microcomputer falls below to the minimum value of recommended operating conditions and re-goes up (ex. battery exchange of an application product), depending on the capacity value of the bypass capacitor added to the power supply pin, the following case may cause program failure (Figure 43);

supply voltage does not fall below to VRST, and

its voltage re-goes up with no reset.

In such a case, please design a system which supply voltage is once reduced below to VRST and re-goes up after that.

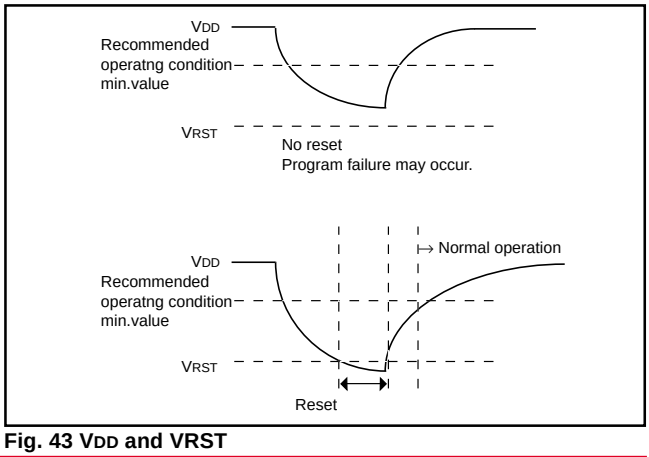

Fig. 43 VDD and VRST

POWER DOWN FUNCTION

The 4554 Group has 2-type power down functions.
System enters into each power down state by executing the following instructions.

• Clock operating mode ..... EPOF and POF instructions
• RAM back-up mode ..... EPOF and POF2 instructions

When the EPOF instruction is not executed before the POF or POF2 instruction is executed, these instructions are equivalent to the NOP instruction.

(1) Clock operating mode

The following functions and states are retained.
• RAM
• Reset circuit
• XCIN–XCOUT oscillation
• LCD display
• Timer 5

(2) RAM back-up mode

The following functions and states are retained.
• RAM
• Reset circuit

(3) Warm start condition

The system returns from the power down state when;
• External wakeup signal is input
• Timer 5 underflow occurs
in the power down mode.
In either case, the CPU starts executing the software from address 0 in page 0. In this case, the P flag is “1.”

(4) Cold start condition

The CPU starts executing the software from address 0 in page 0 when;
• reset pulse is input to $\overline{\text{RESET}}$ pin,
• reset by watchdog timer is performed, or
• reset by the voltage drop detection circuit is performed.
In this case, the P flag is “0.”

(5) Identification of the start condition

Warm start or cold start can be identified by examining the state of the power down flag (P) with the SNZP instruction. The warm start condition from the clock operating mode can be identified by examining the state of T5F flag.

Table 15 Functions and states retained at power down

Function	Power down mode	
	Clock operating	RAM back-up
Program counter (PC), registers A, B, carry flag (CY), stack pointer (SP) (Note 2)	×	×
Contents of RAM	O	O
Interrupt control registers V1, V2	×	×
Interrupt control registers I1, I2	O	O
Selected oscillation circuit	O	O
Clock control register MR	O	O
Timer 1 to timer 4 functions	(Note 3)	(Note 3)
Timer 5 function	O	O
Timer LC function	O	(Note 3)
Watchdog timer function	× (Note 4)	× (Note 4)
Timer control registers PA, W4	×	×
Timer control registers W1 to W3, W5, W6	O	O
LCD display function	O	(Note 5)
LCD control registers L1 to L3	O	O
Voltage drop detection circuit	(Note 6)	(Note 6)
Port level	(Note 7)	(Note 7)
Pull-up control registers PU0, PU1	O	O
Key-on wakeup control registers K0 to K2	O	O
Port output format control registers FR0 to FR2	O	O
External interrupt request flags (EXF0, EXF1)	×	×
Timer interrupt request flags (T1F to T4F)	(Note 3)	(Note 3)
Timer interrupt request flag (T5F)	O	O
Interrupt enable flag (INTE)	×	×
Watchdog timer flags (WDF1, WDF2)	× (Note 4)	× (Note 4)
Watchdog timer enable flag (WEF)	× (Note 4)	× (Note 4)

Notes 1:“O” represents that the function can be retained, and “×” represents that the function is initialized.
Registers and flags other than the above are undefined at RAM back-up, and set an initial value after returning.
2: The stack pointer (SP) points the level of the stack register and is initialized to “7” at RAM back-up.
3: The state of the timer is undefined.
4: Initialize the watchdog timer with the WRST instruction, and then go into the power down state.
5: LCD is turned off.
6: When the SVDE instruction is executed while the VDCE pin is in the “H“ state, this function is valid at power down.
7: In the power down mode, C/CNTR1 pin outputs “L” level.
However, when the CNTR input is selected ($W11$, $W10$=“11”), C/CNTR1 pin is in an input enabled state (output=high-impedance).
Other ports retain their respective output levels.

(6) Return signal

An external wakeup signal or timer 5 interrupt request flag (T5F) is used to return from the clock operating mode.

An external wakeup signal is used to return from the RAM back-up mode because the oscillation is stopped.

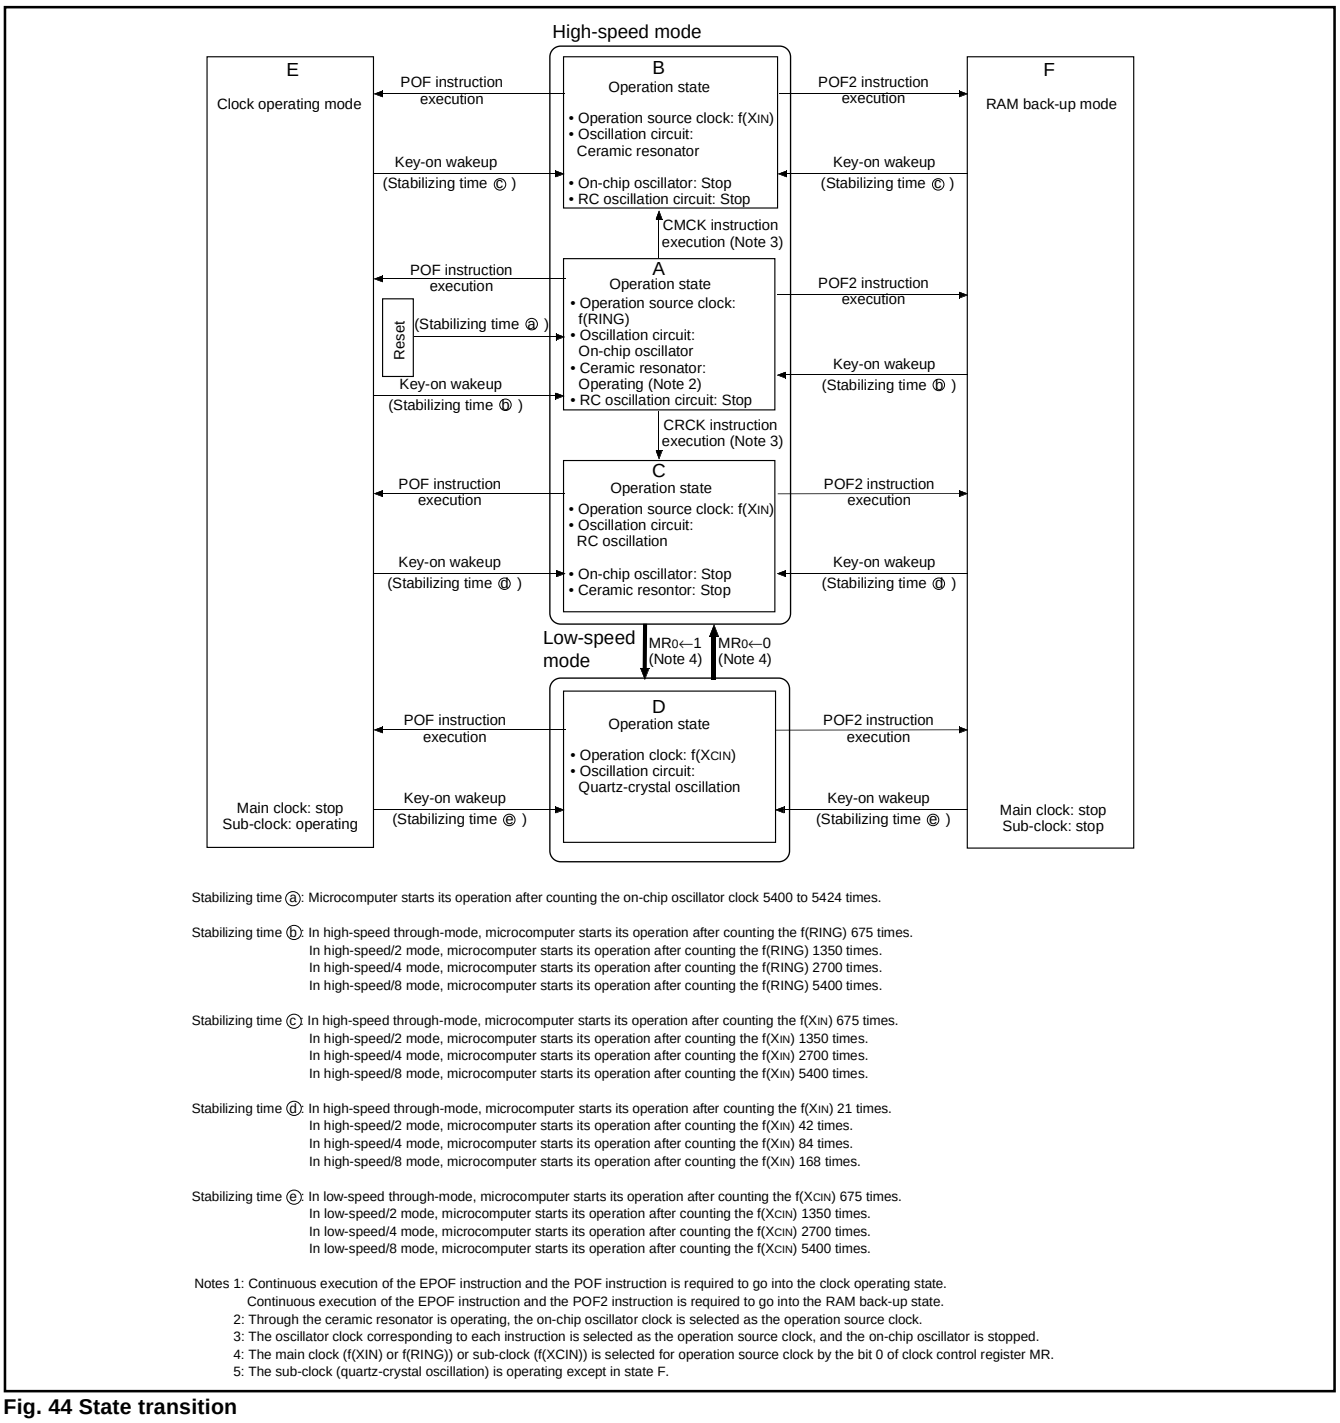
Table 16 shows the return condition for each return source.

(7) Control registers

- Key-on wakeup control register K0
  Register K0 controls the port P0 key-on wakeup function. Set the contents of this register through register A with the TK0A instruction. In addition, the TAK0 instruction can be used to transfer the contents of register K0 to register A.
- Key-on wakeup control register K1
  Register K1 controls the port P1 key-on wakeup function. Set the contents of this register through register A with the TK1A instruction. In addition, the TAK1 instruction can be used to transfer the contents of register K0 to register A.
- Key-on wakeup control register K2
  Register K2 controls the INT0 and INT1 pin key-on wakeup function. Set the contents of this register through register A with the TK2A instruction. In addition, the TAK2 instruction can be used to transfer the contents of register K2 to register A.
- Pull-up control register PU0
  Register PU0 controls the ON/OFF of the port P0 pull-up transistor. Set the contents of this register through register A with the TPU0A instruction. In addition, the TAPU0 instruction can be used to transfer the contents of register PU0 to register A.
- Pull-up control register PU1
  Register PU1 controls the ON/OFF of the port P1 pull-up transistor. Set the contents of this register through register A with the TPU1A instruction. In addition, the TAPU1 instruction can be used to transfer the contents of register PU1 to register A.
- External interrupt control register I1
  Register I1 controls the valid waveform of the external 0 interrupt, the input control of INT0 pin and the return input level. Set the contents of this register through register A with the TI1A instruction. In addition, the TAI1 instruction can be used to transfer the contents of register I1 to register A.
- External interrupt control register I2
  Register I2 controls the valid waveform of the external 1 interrupt, the input control of INT1 pin and the return input level. Set the contents of this register through register A with the TI2A instruction. In addition, the TAI2 instruction can be used to transfer the contents of register I2 to register A.

Table 16 Return source and return condition

Return source		Return condition	Remarks
External wakeup signal	Ports $P0_0$–$P0_3$ Ports $P1_0$–$P1_3$	Return by an external “L” level input.	The key-on wakeup function can be selected by one port unit. Set the port using the key-on wakeup function to “H” level before going into the power down state.
	INT0 pin INT1 pin	Return by an external “H” level or “L” level input, or rising edge (“L”→“H”) or falling edge (“H”→“L”). When the return level is input, the interrupt request flag (EXF0, EXF1) is not set.	Select the return level (“L” level or “H” level) with register I1 (I2) and return condition (return by level or edge) with register K2 according to the external state before going into the power down state.
Timer 5 interrupt request flag (T5F)		Return by timer 5 underflow or by setting T5F to “1”. It can be used in the clock operating mode.	Clear T5F with the SNZT5 instruction before system enters into the power down state. When system enters into the power down state while T5F is “1”, system returns from the state immediately because it is recognized as return condition.



Stabilizing time ⓐ: Microcomputer starts its operation after counting the on-chip oscillator clock 5400 to 5424 times.

Stabilizing time ⓑ: In high-speed through-mode, microcomputer starts its operation after counting the f(RING) 675 times.
In high-speed/2 mode, microcomputer starts its operation after counting the f(RING) 1350 times.
In high-speed/4 mode, microcomputer starts its operation after counting the f(RING) 2700 times.
In high-speed/8 mode, microcomputer starts its operation after counting the f(RING) 5400 times.

Stabilizing time ⓒ: In high-speed through-mode, microcomputer starts its operation after counting the f(XIN) 675 times.
In high-speed/2 mode, microcomputer starts its operation after counting the f(XIN) 1350 times.
In high-speed/4 mode, microcomputer starts its operation after counting the f(XIN) 2700 times.
In high-speed/8 mode, microcomputer starts its operation after counting the f(XIN) 5400 times.

Stabilizing time ⓓ: In high-speed through-mode, microcomputer starts its operation after counting the f(XIN) 21 times.
In high-speed/2 mode, microcomputer starts its operation after counting the f(XIN) 42 times.
In high-speed/4 mode, microcomputer starts its operation after counting the f(XIN) 84 times.
In high-speed/8 mode, microcomputer starts its operation after counting the f(XIN) 168 times.

Stabilizing time ⓔ: In low-speed through-mode, microcomputer starts its operation after counting the f(XCIN) 675 times.
In low-speed/2 mode, microcomputer starts its operation after counting the f(XCIN) 1350 times.
In low-speed/4 mode, microcomputer starts its operation after counting the f(XCIN) 2700 times.
In low-speed/8 mode, microcomputer starts its operation after counting the f(XCIN) 5400 times.

Notes 1: Continuous execution of the EPOF instruction and the POF instruction is required to go into the clock operating state.
Continuous execution of the EPOF instruction and the POF2 instruction is required to go into the RAM back-up state.
2: Through the ceramic resonator is operating, the on-chip oscillator clock is selected as the operation source clock.
3: The oscillator clock corresponding to each instruction is selected as the operation source clock, and the on-chip oscillator is stopped.
4: The main clock (f(XIN) or f(RING)) or sub-clock (f(XCIN)) is selected for operation source clock by the bit 0 of clock control register MR.
5: The sub-clock (quartz-crystal oscillation) is operating except in state F.

$I1_1$	INT0 pin edge detection circuit control bit	0	One-sided edge detected		
		1	Both edges detected		
$I1_0$	INT0 pin Timer 1 count start synchronous circuit selection bit	0	Timer 1 count start synchronous circuit not selected		
		1	Timer 1 count start synchronous circuit selected		

Interrupt control register I2		at reset : 0000_2		at power down : state retained	R/W TAI2/TI2A
$I2_3$	INT1 pin input control bit (Note 2)	0	INT1 pin input disabled		
		1	INT1 pin input enabled		
$I2_2$	Interrupt valid waveform for INT1 pin/ return level selection bit (Note 2)	0	Falling waveform/"L" level ("L" level is recognized with the SNZI1 instruction)		
		1	Rising waveform/"H" level ("H" level is recognized with the SNZI1 instruction)		
$I2_1$	INT1 pin edge detection circuit control bit	0	One-sided edge detected		
		1	Both edges detected		
$I2_0$	INT1 pin Timer 3 count start synchronous circuit selection bit	0	Timer 3 count start synchronous circuit not selected		
		1	Timer 3 count start synchronous circuit selected		

Notes 1: "R" represents read enabled, and "W" represents write enabled.
2: When the contents of $I1_2$, $I1_3$ $I2_2$ and $I2_3$ are changed, the external interrupt request flag (EXF0, EXF1) may be set.

CLOCK CONTROL

The clock control circuit consists of the following circuits.

- On-chip oscillator (internal oscillator)
- Ceramic resonator
- RC oscillation circuit
- Quartz-crystal oscillation circuit
- Multi-plexer (clock selection circuit)
- Frequency divider
- Internal clock generating circuit

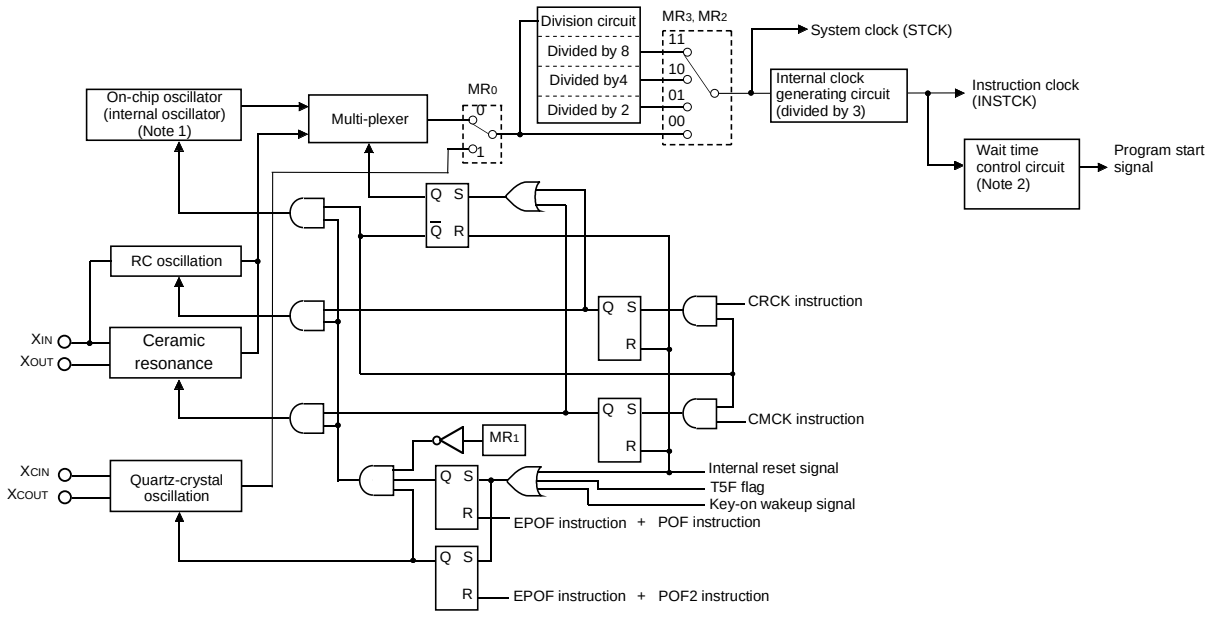
The system clock and the instruction clock are generated as the source clock for operation by these circuits.

Figure 47 shows the structure of the clock control circuit.

The 4554 Group operates by the on-chip oscillator clock (f(RING)) which is the internal oscillator after system is released from reset.

Also, the ceramic resonator or the RC oscillation can be used for the main clock (f(XIN)) of the 4554 Group. The CMCK instruction or CRCK instruction is executed to select the ceramic resonator or RC oscillator, respectively.

The quartz-crystal oscillator can be used for sub-clock (f(XCIN)).



Notes 1: System operates by the on-chip oscillator clock (f(RING)) until the CMCK or CRCK instruction is executed after system is released from reset.

2: The wait time control circuit is used to generate the time required to stabilize the f(XIN) or f(XCIN) oscillation. After the certain oscillation stabilizing wait time elapses, the program start signal is output. This circuit operates when system is released from reset or returned from RAM back-up.

Fig. 47 Clock control circuit structure

(1) Main clock generating circuit (f(XIN))

The ceramic resonator or RC oscillation can be used for the main clock of this MCU.

After system is released from reset, the MCU starts operation by the clock output from the on-chip oscillator which is the internal oscillator.

When the ceramic resonator is used, execute the CMCK instruction. When the RC oscillation is used, execute the CRCK instruction. The oscillation circuit by the CMCK or CRCK instruction can be selected only at once. The oscillation circuit corresponding to the first executed one of these two instructions is valid. Other oscillation circuit and the on-chip oscillator stop.

Execute the CMCK or the CRCK instruction in the initial setting routine of program (executing it in address 0 in page 0 is recommended). Also, when the CMCK or the CRCK instruction is not executed in program, this MCU operates by the on-chip oscillator.

(2) On-chip oscillator operation

When the MCU operates by the on-chip oscillator as the main clock (f(XIN)) without using the ceramic resonator or the RC oscillator, connect XIN pin to VSS and leave XOUT pin open (Figure 49).

The clock frequency of the on-chip oscillator depends on the supply voltage and the operation temperature range.

Be careful that variable frequencies when designing application products.

(3) Ceramic resonator

When the ceramic resonator is used as the main clock (f(XIN)), connect the ceramic resonator and the external circuit to pins XIN and XOUT at the shortest distance. Then, execute the CMCK instruction. A feedback resistor is built in between pins XIN and XOUT (Figure 50).

(4) RC oscillation

When the RC oscillation is used as the main clock (f(XIN)), connect the XIN pin to the external circuit of resistor R and the capacitor C at the shortest distance and leave XOUT pin open. Then, execute the CRCK instruction (Figure 51).

The frequency is affected by a capacitor, a resistor and a microcomputer. So, set the constants within the range of the frequency limits.

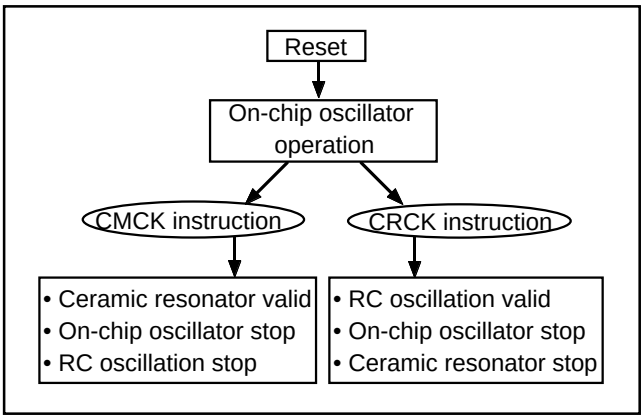


Fig. 48 Switch to ceramic resonance/RC oscillation

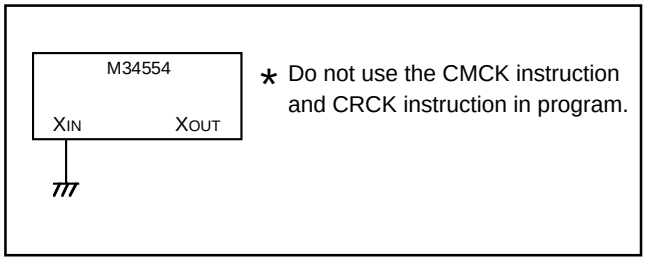

Fig. 49 Handling of XIN and XOUT when operating on-chip oscillator

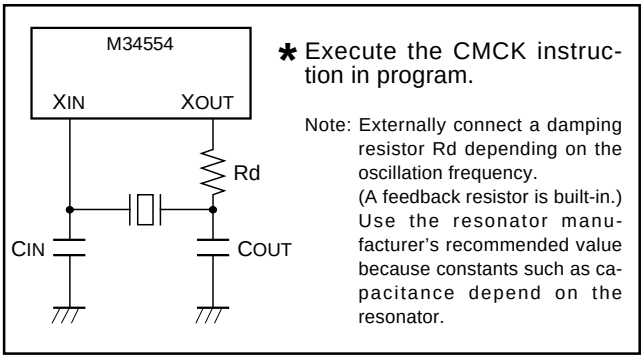

Fig. 50 Ceramic resonator external circuit

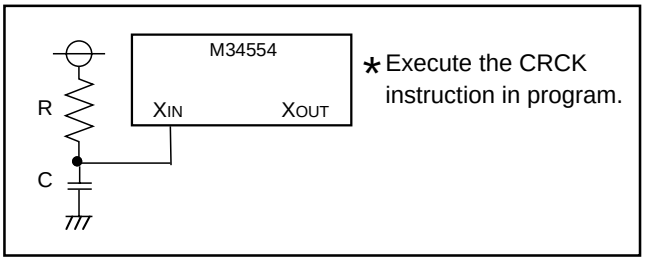

Fig. 51 External RC oscillation circuit

(5) External clock

When the external clock signal is used as the main clock (f(XIN)), connect the XIN pin to the clock source and leave XOUT pin open. Then, execute the CMCK instruction (Figure 52).

Be careful that the maximum value of the oscillation frequency when using the external clock differs from the value when using the ceramic resonator (refer to the recommended operating condition). Also, note that the power down mode (POF and POF2 instructions) cannot be used when using the external clock.

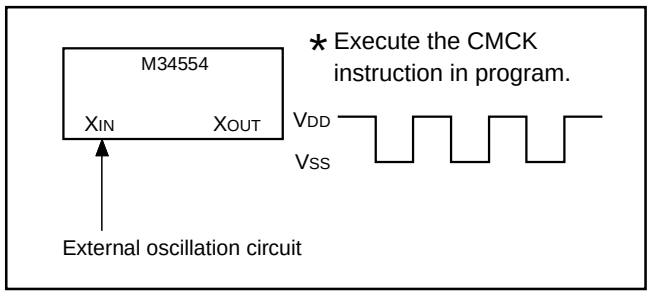

Fig. 52 External clock input circuit

(6) Sub-clock generating circuit f(XCIN)

Sub-clock signal f(XCIN) is obtained by externally connecting a quartz-crystal oscillator. Connect this external circuit and a quartz-crystal oscillator to pins XCIN and XCOUT at the shortest distance. A feedback resistor is built in between pins XCIN and XCOUT (Figure 53).

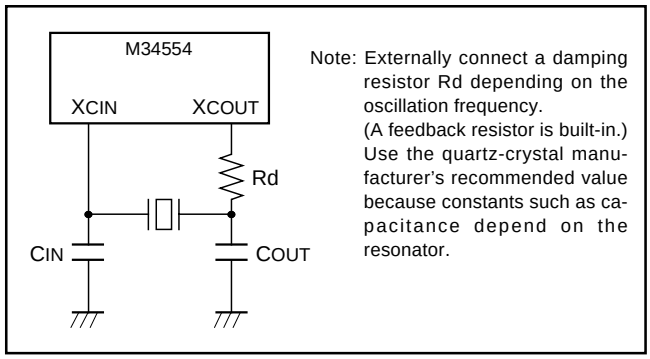

Fig. 53 External quartz-crystal circuit

(7) Clock control register MR

Register MR controls system clock. Set the contents of this register through register A with the TMRA instruction. In addition, the TAMR instruction can be used to transfer the contents of register MR to register A.

Table 18 Clock control register MR

Clock control register MR		at reset : 1100_2		at power down : state retained	R/W TAMR/ TMRA
MR3	Operation mode selection bits	MR3	MR2	Operation mode	
		0	0	Through mode (frequency not divided)	
MR2		0	1	Frequency divided by 2 mode	
		1	0	Frequency divided by 4 mode	
		1	1	Frequency divided by 8 mode	
MR1	Main clock oscillation circuit control bit	0		Main clock oscillation enabled	
		1		Main clock oscillation stop	
MR0	System clock selection bit	0		Main clock (f(XIN) or f(RING))	
		1		Sub-clock (f(XCIN))	

Note : "R" represents read enabled, and "W" represents write enabled.

ROM ORDERING METHOD

1.Mask ROM Order Confirmation Form•
2.Mark Specification Form•
3.Data to be written to ROM, in EPROM form (three identical copies) or one floppy disk.

•For the mask ROM confirmation and the mark specifications, refer to the "Renesas Technology Corp." Homepage (http://www.renesas.com/en/rom).

LIST OF PRECAUTIONS

①Noise and latch-up prevention

Connect a capacitor on the following condition to prevent noise and latch-up;

- connect a bypass capacitor (approx. 0.1 μF) between pins V_{DD} and V_{SS} at the shortest distance,
- equalize its wiring in width and length, and
- use relatively thick wire.

In the One Time PROM version, CNV_{SS} pin is also used as V_{PP} pin. Accordingly, when using this pin, connect this pin to V_{SS} through a resistor about 5 kΩ (connect this resistor to CNV_{SS}/V_{PP} pin as close as possible).

②Register initial values 1

The initial value of the following registers are undefined after system is released from reset. After system is released from reset, set initial values.

- Register Z (2 bits)
- Register D (3 bits)
- Register E (8 bits)

③Register initial values 2

The initial value of the following registers are undefined at RAM back-up. After system is returned from RAM back-up, set initial values.

- Register Z (2 bits)
- Register X (4 bits)
- Register Y (4 bits)
- Register D (3 bits)
- Register E (8 bits)

④ Stack registers (SKs)

Stack registers (SKs) are eight identical registers, so that subroutines can be nested up to 8 levels. However, one of stack registers is used respectively when using an interrupt service routine and when executing a table reference instruction. Accordingly, be careful not to over the stack when performing these operations together.

⑤Prescaler

Stop counting and then execute the TABPS instruction to read from prescaler data.

Stop counting and then execute the TPSAB instruction to set prescaler data.

⑥Timer count source

Stop timer 1, 2, 3, 4 and LC counting to change its count source.

⑦Reading the count value

Stop timer 1, 2, 3 or 4 counting and then execute the data read instruction (TAB1, TAB2, TAB3, TAB4) to read its data.

⑧Writing to the timer

Stop timer 1, 2, 3, 4 or LC counting and then execute the data write instruction (T1AB, T2AB, T3AB, T4AB, TLCA) to write its data.

⑨Writing to reload register R1, R3, R4H

When writing data to reload register R1, reload register R3 or reload regiser R4H while timer 1, timer 3 or timer 4 is operating, avoid a timing when timer 1, timer 3 or timer 4 underflows.

⑩Timer 4

Avoid a timing when timer 4 underflows to stop timer 4.

When “H” interval extension function of the PWM signal is set to be “valid”, set “1” or more to reload register R4H.

⑪Timer 5

Stop timer 5 counting to change its count source.

⑫Timer input/output pin

Set the port C output latch to “0” to output the PWM signal from C/CNTR pin.

⑬Watchdog timer

- The watchdog timer function is valid after system is released from reset. When not using the watchdog timer function, execute the DWDT instruction and the WRST instruction continuously, and clear the WEF flag to “0” to stop the watchdog timer function.
- The watchdog timer function is valid after system is returned from the power down state. When not using the watchdog timer function, execute the DWDT instruction and the WRST instruction continuously every system is returned from the power down state, and stop the watchdog timer function.
- When the watchdog timer function and power down function are used at the same time, execute the WRST instruction before system enters into the power down state and initialize the flag WDF1.

⑭Multifunction

- Be careful that the output of ports D_8 and D_9 can be used even when INT0 and INT1 pins are selected.
- Be careful that the input/output of port D_7 can be used even when input of CNTR0 pin are selected.
- Be careful that the input of port D_7 can be used even when output of CNTR0 pin are selected.
- Be careful that the “H” output of port C can be used even when output of CNTR1 pin are selected.

⑮Program counter

Make sure that the PC_H does not specify after the last page of the built-in ROM.

⑯ D8/INT0 pin

❶ Note [1] on bit 3 of register I1

When the input of the INT0 pin is controlled with the bit 3 of register I1 in software, be careful about the following notes.

• Depending on the input state of the D8/INT0 pin, the external 0 interrupt request flag (EXF0) may be set when the bit 3 of register I1 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 0 of register V1 to "0" (refer to Figure 54①) and then, change the bit 3 of register I1.
In addition, execute the SNZ0 instruction to clear the EXF0 flag to "0" after executing at least one instruction (refer to Figure 54②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ0 instruction (refer to Figure 54③).

```
      ⋮
LA    4       ; (XXX0₂)
TV1A          ; The SNZ0 instruction is valid ..... ①
LA    8       ; (1XXX₂)
TI1A          ; Control of INT0 pin input is changed
NOP           ..... ②
SNZ0          ; The SNZ0 instruction is executed
              (EXF0 flag cleared)
NOP           ..... ③
      ⋮
   X : these bits are not used here.
```

Fig. 54 External 0 interrupt program example-1

❷ Note [2] on bit 3 of register I1

When the bit 3 of register I1 is cleared to "0", the RAM back-up mode is selected and the input of INT0 pin is disabled, be careful about the following notes.

• When the key-on wakeup function of INT0 pin is not used (register $K2_0$ = "0"), clear bits 2 and 3 of register I1 before system enters to the RAM back-up mode. (refer to Figure 55①).

```
      ⋮
LA    0       ; (00XX₂)
TI1A          ; Input of INT0 disabled ..... ①
DI
EPOF
POF2          ; RAM back-up
      ⋮
   X : these bits are not used here.
```

Fig. 55 External 0 interrupt program example-2

❸ Note on bit 2 of register I1

When the interrupt valid waveform of the D8/INT0 pin is changed with the bit 2 of register I1 in software, be careful about the following notes.

• Depending on the input state of the D8/INT0 pin, the external 0 interrupt request flag (EXF0) may be set when the bit 2 of register I1 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 0 of register V1 to "0" (refer to Figure 56①) and then, change the bit 2 of register I1.
In addition, execute the SNZ0 instruction to clear the EXF0 flag to "0" after executing at least one instruction (refer to Figure 56②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ0 instruction (refer to Figure 56③).

```
      ⋮
LA    4       ; (XXX0₂)
TV1A          ; The SNZ0 instruction is valid ..... ①
LA    12      ; (X1XX₂)
TI1A          ; Interrupt valid waveform is changed
NOP           ..... ②
SNZ0          ; The SNZ0 instruction is executed
              (EXF0 flag cleared)
NOP           ..... ③
      ⋮
   X : these bits are not used here.
```

Fig. 56 External 0 interrupt program example-3

⑰ D9/INT1 pin

❶ Note [1] on bit 3 of register I2

When the input of the INT1 pin is controlled with the bit 3 of register I2 in software, be careful about the following notes.

• Depending on the input state of the D9/INT1 pin, the external 1 interrupt request flag (EXF1) may be set when the bit 3 of register I2 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 1 of register V1 to "0" (refer to Figure 57①) and then, change the bit 3 of register I2.
In addition, execute the SNZ1 instruction to clear the EXF1 flag to "0" after executing at least one instruction (refer to Figure 57②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ1 instruction (refer to Figure 57③).

```
      ⋮
LA    4       ; (XX0X2)
TV1A          ; The SNZ1 instruction is valid .....①
LA    8       ; (1XXX2)
TI2A          ; Control of INT1 pin input is changed
NOP           ..... ②
SNZ1          ; The SNZ1 instruction is executed
              (EXF1 flag cleared)
NOP           ..... ③
      ⋮
   X : these bits are not used here.
```

Fig. 57 External 1 interrupt program example-1

❷ Note [2] on bit 3 of register I2

When the bit 3 of register I2 is cleared to "0", the RAM back-up mode is selected and the input of INT1 pin is disabled, be careful about the following notes.

• When the key-on wakeup function of INT1 pin is not used (register K22 = "0"), clear bits 2 and 3 of register I2 before system enters to the RAM back-up mode. (refer to Figure 58①).

```
      ⋮
LA    0       ; (00XX2)
TI2A          ; Input of INT1 disabled .....①
DI
EPOF
POF2          ; RAM back-up
      ⋮
   X : these bits are not used here.
```

Fig. 58 External 1 interrupt program example-2

❸ Note on bit 2 of register I2

When the interrupt valid waveform of the D9/INT1 pin is changed with the bit 2 of register I2 in software, be careful about the following notes.

• Depending on the input state of the D9/INT1 pin, the external 1 interrupt request flag (EXF1) may be set when the bit 2 of register I2 is changed. In order to avoid the occurrence of an unexpected interrupt, clear the bit 1 of register V1 to "0" (refer to Figure 59①) and then, change the bit 2 of register I2.
In addition, execute the SNZ1 instruction to clear the EXF1 flag to "0" after executing at least one instruction (refer to Figure 59②).
Also, set the NOP instruction for the case when a skip is performed with the SNZ1 instruction (refer to Figure 59③).

```
      ⋮
LA    4       ; (XX0X2)
TV1A          ; The SNZ1 instruction is valid .....①
LA    12      ; (X1XX2)
TI2A          ; Interrupt valid waveform is changed
NOP           ..... ②
SNZ1          ; The SNZ1 instruction is executed
              (EXF1 flag cleared)
NOP           ..... ③
      ⋮
   X : these bits are not used here.
```

Fig. 59 External 1 interrupt program example-3

⑱ POF and POF2 instructions

When the POF or POF2 instruction is executed continuously after the EPOF instruction, system enters the power down state.
Note that system cannot enter the power down state when executing only the POF or POF2 instruction.
Be sure to disable interrupts by executing the DI instruction before executing the EPOF instruction and the POF or POF2 instruction continuously.

⑲ Power-on reset

When the built-in power-on reset circuit is used, the time for the supply voltage to rise from 0 V to 2.0 V must be set to 100 µs or less. If the rising time exceeds 100 µs, connect a capacitor between the $\overline{\text{RESET}}$ pin and Vss at the shortest distance, and input "L" level to $\overline{\text{RESET}}$ pin until the value of supply voltage reaches the minimum operating voltage.

⑳ Note on voltage drop detection circuit

The voltage drop detection circuit detection voltage of this product is set up lower than the minimum value of the supply voltage of the recommended operating conditions.
When the supply voltage of a microcomputer falls below to the minimum value of recommended operating conditions and re-goes up (ex. battery exchange of an application product), depending on the capacity value of the bypass capacitor added to the power supply pin, the following case may cause program failure (Figure 60);
supply voltage does not fall below to VRST, and
its voltage re-goes up with no reset.
In such a case, please design a system which supply voltage is once reduced below to VRST and re-goes up after that.

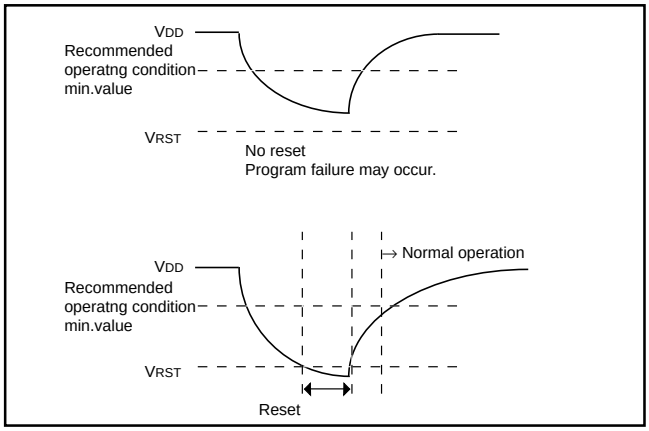

Fig. 60 VDD and VRST

㉑ Clock control

Execute the CMCK or the CRCK instruction in the initial setting routine of program (executing it in address 0 in page 0 is recommended).
The oscillation circuit by the CMCK or CRCK instruction can be selected only at once. The oscillation circuit corresponding to the first executed one of these two instruction is valid. Other oscillation circuits and the on-chip oscillator stop.

㉒ On-chip oscillator

The clock frequency of the on-chip oscillator depends on the supply voltage and the operation temperature range.
Be careful that variable frequencies when designing application products.
Also, the oscillation stabilize wait time after system is released from reset is generated by the on-chip oscillator clock. When considering the oscillation stabilize wait time after system is released from reset, be careful that the variable frequency of the on-chip oscillator clock.

㉓ External clock

When the external signal clock is used as the source oscillation (f(XIN)), note that the power down mode (POF and POF2 instructions) cannot be used.

㉔ Difference between Mask ROM version and One Time PROM version

Mask ROM version and One Time PROM version have some difference of the following characteristics within the limits of an electrical property by difference of a manufacture process, built-in ROM, and a layout pattern.

- a characteristic value
- a margin of operation
- the amount of noise-proof
- noise radiation, etc.,

Accordingly, be careful of them when swithcing.

㉕ Note on Power Source Voltage

When the power source voltage value of a microcomputer is less than the value which is indicated as the recommended operating conditions, the microcomputer does not operate normally and may perform unstable operation.
In a system where the power source voltage drops slowly when the power source voltage drops or the power supply is turned off, reset a microcomputer when the supply voltage is less than the recommended operating conditions and design a system not to cause errors to the system by this unstable operation.

CONTROL REGISTERS

Interrupt control register V1		at reset : 0000_2	at power down : 0000_2	R/W TAV1/TV1A
$V1_3$	Timer 2 interrupt enable bit	0	Interrupt disabled (SNZT2 instruction is valid)

		1	Prescaler output (ORCLK) divided by 2		

Timer control register W5		at reset : 0000_2		at power down : state retained	R/W TAW5/TW5A
$W5_3$	Not used	0	This bit has no function, but read/write is enabled.		
		1			
$W5_2$	Timer 5 control bit	0	Stop (state initialized)		
		1	Operating		
$W5_1$	Timer 5 count value selection bits	$W5_1$	$W5_0$	Count value	
		0	0	Underflow occurs every 8192 counts	
$W5_0$		0	1	Underflow occurs every 16384 counts	
		1	0	Underflow occurs every 32768 counts	
		1	1	Underflow occurs every 65536 counts	

Timer control register W6		at reset : 0000_2		at power down : state retained	R/W TAW6/TW6A
$W6_3$	Timer LC control bit	0	Stop (state retained)		
		1	Operating		
$W6_2$	Timer LC count source selection bit	0	Bit 4 ($T5_4$) of timer 5		
		1	Prescaler output (ORCLK)		
$W6_1$	CNTR1 output auto-control circuit selection bit	0	CNTR1 output auto-control circuit not selected		
		1	CNTR1 output auto-control circuit selected		
$W6_0$	D_7/CNTR0 pin function selection bit (Note 2)	0	D_7(I/O)/CNTR0 input		
		1	CNTR input/output/D_7 (input)		

Notes 1: “R” represents read enabled, and “W” represents write enabled.
2: CNTR0 input is valid only when CNTR0 input is selected for the timer 1 count source.

LCD control register L1		at reset : 0000_2		at power down : state retained		R/W TAL1/TL1A
$L1_3$	Internal dividing resistor for LCD power supply selection bit (Note 2)	0		2r × 3, 2r × 2		
		1		r × 3, r × 2		
$L1_2$	LCD control bit	0		Off		
		1		On		
$L1_1$	LCD duty and bias selection bits	$L1_1$	$L1_0$	Duty	Bias	
		0	0	Not available		
$L1_0$		0	1	1/2	1/2	
		1	0	1/3	1/3	
		1	1	1/4	1/3	

LCD control register L2		at reset : 0000_2	at power down : state retained	W TL2A
$L2_3$	V_{LC3}/SEG_0 pin function switch bit (Note 3)	0	SEG_0	
		1	V_{LC3}	
$L2_2$	V_{LC2}/SEG_1 pin function switch bit (Note 4)	0	SEG_1	
		1	V_{LC2}	
$L2_1$	V_{LC1}/SEG_2 pin function switch bit (Note 4)	0	SEG_2	
		1	V_{LC1}	
$L2_0$	Internal dividing resistor for LCD power supply control bit	0	Internal dividing resistor valid	
		1	Internal dividing resistor invalid	

LCD control register L3		at reset : 0000_2	at power down : state retained	W TL3A
$L3_3$	SEG_{24}/$P3_3$–SEG_{27}/$P3_0$ pin function switch bit	0	SEG_{24}–SEG_{27}	
		1	$P3_3$–$P3_0$	
$L3_2$	SEG_{28}/$P2_3$, SEG_{29}/$P2_2$ pin function switch bit	0	SEG_{28}, SEG_{29}	
		1	$P2_3$, $P2_2$	
$L3_1$	SEG_{30}/$P2_1$ pin function switch bit	0	SEG_{30}	
		1	$P2_1$	
$L3_0$	SEG_{31}/$P2_0$ pin function switch bit	0	SEG_{31}	
		1	$P2_0$	

Notes 1: "R" represents read enabled, and "W" represents write enabled.
2: "r (resistor) multiplied by 3" is used at 1/3 bias, and "r multiplied by 2" is used at 1/2 bias.
3: V_{LC3} is connected to V_{DD} internally when SEG_0 pin is selected.
4: Use internal dividing resistor when SEG_1 and SEG_2 pins are selected.

Pull-up control register PU0		at reset : 0000_2		at power down : state retained	R/W TAPU0/ TPU0A
$PU0_3$	Port $P0_3$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU0_2$	Port $P0_2$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU0_1$	Port $P0_1$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU0_0$	Port $P0_0$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		

Pull-up control register PU1		at reset : 0000_2		at power down : state retained	R/W TAPU1/ TPU1A
$PU1_3$	Port $P1_3$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU1_2$	Port $P1_2$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU1_1$	Port $P1_1$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		
$PU1_0$	Port $P1_0$ pull-up transistor control bit	0	Pull-up transistor OFF		
		1	Pull-up transistor ON		

Port output structure control register FR0		at reset : 0000_2		at power down : state retained	W TFR0A
$FR0_3$	Ports $P1_2$, $P1_3$ output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR0_2$	Ports $P1_0$, $P1_1$ output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR0_1$	Ports $P0_2$, $P0_3$ output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR0_0$	Ports $P0_0$, $P0_1$ output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		

Port output structure control register FR1		at reset : 0000_2		at power down : state retained	W TFR1A
$FR1_3$	Port D_3 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR1_2$	Port D_2 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR1_1$	Port D_1 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR1_0$	Port D_0 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		

Port output structure control register FR2		at reset : 0000_2		at power down : state retained	W TFR2A
$FR2_3$	Port D_7/CNTR0 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR2_2$	Port D_6 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR2_1$	Port D_5 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		
$FR2_0$	Port D_4 output structure selection bit	0	N-channel open-drain output		
		1	CMOS output		

Note: “R” represents read enabled, and “W” represents write enabled.

Key-on wakeup control register K0		at reset : 0000_2		at power down : state retained	R/W TAK0/ TK0A
$K0_3$	Port $P0_3$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K0_2$	Port $P0_2$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K0_1$	Port $P0_1$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K0_0$	Port $P0_0$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		

Key-on wakeup control register K1		at reset : 0000_2		at power down : state retained	R/W TAK1/ TK1A
$K1_3$	Port $P1_3$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K1_2$	Port $P1_2$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K1_1$	Port $P1_1$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		
$K1_0$	Port $P1_0$ key-on wakeup control bit	0	Key-on wakeup not used		
		1	Key-on wakeup used		

Key-on wakeup control register K2		at reset : 0000_2		at power down : state retained	R/W TAK2/ TK2A
$K2_3$	INT1 pin return condition selection bit	0	Returned by level		
		1	Returned by edge		
$K2_2$	INT1 pin key-on wakeup control bit	0	Key-on wakeup invalid		
		1	Key-on wakeup valid		
$K2_1$	INT0 pin return condition selection bit	0	Returned by level		
		1	Returned by edge		
$K2_0$	INT0 pin key-on wakeup control bit	0	Key-on wakeup invalid		
		1	Key-on wakeup valid		

Note: “R” represents read enabled, and “W” represents write enabled.

INSTRUCTIONS

The 4554 Group has the 136 instructions. Each instruction is described as follows;

(1) Index list of instruction function
(2) Machine instructions (index by alphabet)
(3) Machine instructions (index by function)
(4) Instruction code table

SYMBOL

The symbols shown below are used in the following list of instruction function and the machine instructions.

Symbol	Contents	Symbol	Contents
A	Register A (4 bits)	PS	Prescaler
B	Register B (4 bits)	T1	Timer 1
DR	Register DR (3 bits)	T2	Timer 2
E	Register E (8 bits)	T3	Timer 3
V1	Interrupt control register V1 (4 bits)	T4	Timer 4
V2	Interrupt control register V2 (4 bits)	T5	Timer 5
I1	Interrupt control register I1 (4 bits)	TLC	Timer LC
I2	Interrupt control register I2 (4 bits)	T1F	Timer 1 interrupt request flag
MR	Clock control register MR (4 bits)	T2F	Timer 2 interrupt request flag
PA	Timer control register PA (1 bit)	T3F	Timer 3 interrupt request flag
W1	Timer control register W1 (4 bits)	T4F	Timer 4 interrupt request flag
W2	Timer control register W2 (4 bits)	T5F	Timer 5 interrupt request flag
W3	Timer control register W3 (4 bits)	WDF1	Watchdog timer flag
W4	Timer control register W4 (4 bits)	WEF	Watchdog timer enable flag
W5	Timer control register W5 (4 bits)	INTE	Interrupt enable flag
W6	Timer control register W6 (4 bits)	EXF0	External 0 interrupt request flag
L1	LCD control register L1 (4 bits)	EXF1	External 1 interrupt request flag
L2	LCD control register L2 (4 bits)	P	Power down flag
L3	LCD control register L3 (4 bits)		
PU0	Pull-up control register PU0 (4 bits)	D	Port D (10 bits)
PU1	Pull-up control register PU1 (4 bits)	P0	Port P0 (4 bits)
FR0	Port output format control register FR0 (4 bits)	P1	Port P1 (4 bits)
FR1	Port output format control register FR1 (4 bits)	P2	Port P2 (4 bits)
FR2	Port output format control register FR2 (4 bits)	P3	Port P3 (4 bits)
FR3	Port output format control register FR3 (4 bits)	C	Port C (1 bit)
K0	Key-on wakeup control register K0 (4 bits)		
K1	Key-on wakeup control register K1 (4 bits)	x	Hexadecimal variable
K2	Key-on wakeup control register K2 (4 bits)	y	Hexadecimal variable
X	Register X (4 bits)	z	Hexadecimal variable
Y	Register Y (4 bits)	p	Hexadecimal variable
Z	Register Z (2 bits)	n	Hexadecimal constant
DP	Data pointer (10 bits)	i	Hexadecimal constant
	(It consists of registers X, Y, and Z)	j	Hexadecimal constant
PC	Program counter (14 bits)	$A_3A_2A_1A_0$	Binary notation of hexadecimal variable A
PC_H	High-order 7 bits of program counter		(same for others)
PC_L	Low-order 7 bits of program counter		
SK	Stack register (14 bits × 8)	←	Direction of data movement
SP	Stack pointer (3 bits)	↔	Data exchange between a register and memory
CY	Carry flag	?	Decision of state shown before "?"
RPS	Prescaler reload register (8 bits)	( )	Contents of registers and memories
R1	Timer 1 reload register (8 bits)	—	Negate, Flag unchanged after executing instruction
R2	Timer 2 reload register (8 bits)	M(DP)	RAM address pointed by the data pointer
R3	Timer 3 reload register (8 bits)	a	Label indicating address a_6 a_5 a_4 a_3 a_2 a_1 a_0
R4L	Timer 4 reload register (8 bits)	p, a	Label indicating address a_6 a_5 a_4 a_3 a_2 a_1 a_0
R4H	Timer 4 reload register (8 bits)		in page p_5 p_4 p_3 p_2 p_1 p_0
RLC	Timer LC reload register (4 bits)	C + x	Hex. C + Hex. number x

Note : Some instructions of the 4554 Group has the skip function to unexecute the next described instruction. The 4554 Group just invalidates the next instruction when a skip is performed. The contents of program counter is not increased by 2. Accordingly, the number of cycles does not change even if skip is not performed. However, the cycle count becomes "1" if the TABP p, RT, or RTS instruction is skipped.

INDEX LIST OF INSTRUCTION FUNCTION

Group-ing	Mnemonic	Function	Page
Register to register transfer	TAB	(A) ← (B)	95, 112
	TBA	(B) ← (A)	103, 112
	TAY	(A) ← (Y)	102, 112
	TYA	(Y) ← (A)	110, 112

	SD	(D(Y)) ← 1 (Y) = 0 to 9	89, 122
	SZD	(D(Y)) = 0 ? (Y) = 0 to 7	93, 122
	RCP	(C) ← 0	87, 122
	SCP	(C) ← 1	89, 122
	TAPU0	(A) ← (PU0)	99, 122
	TPU0A	(PU0) ← (A)	107, 122
	TAPU1	(A) ← (PU1)	99, 122
	TPU1A	(PU1) ← (A)	108, 122
	TAK0	(A) ← (K0)	98, 124
	TK0A	(K0) ← (A)	105, 124
	TAK1	(A) ← (K1)	98, 124
	TK1A	(K1) ← (A)	105, 124
	TAK2	(A) ← (K2)	98, 124
	TK2A	(K2) ← (A)	105, 124
	TFR0A	(FR0) ← (A)	103, 124
	TFR1A	(FR1) ← (A)	104, 124
	TFR2A	(FR2) ← (A)	104, 124
Clock operation	CMCK	Ceramic resonator selected	81, 124
	CRCK	RC oscillator selected	81, 124
	TAMR	(A) ← (MR)	99, 124
	TMRA	(MR) ← (A)	107, 124

Group-ing	Mnemonic	Function	Page
LCD operation	TAL1	(A) ← (L1)	116, 124
	TL1A	(L1) ← (A)	124, 124
	TL2A	(L2) ← (A)	124, 124
	TL3A	(L3) ← (A)	113, 124
Other operation	NOP	(PC) ← (PC) + 1	128, 124
	POF	Transition to clock operating mode	108, 124
	POF2	Transition to RAM back-up mode	107, 124
	EPOF	POF, POF2 instructions valid	115, 124
	SNZP	(P) = 1 ?	123, 124
	DWDT	Stop of watchdog timer function enabled	112, 146
	WRST	(WDF1) = 1 ? After skipping, (WDF1) ← 0	116, 146
	RBK*	When TABP p instruction is executed, P_6 ← 0	114, 146
	SBK*	When TABP p instruction is executed, P_6 ← 1	92, 146
	SVDE	At power down mode, voltage drop detection circuit valid	106, 146

Note: *(RBK, SBK) cannot be used in the M34554M8.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET)

A n (Add n and accumulator)

Instruction code

D9									D0				
0	0	0	1	1	0	n	n	n	n	2	0 6 n	16	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	Overflow = 0

Operation: (A) ← (A) + n
n = 0 to 15

Grouping: Arithmetic operation

Description: Adds the value n in the immediate field to register A, and stores a result in register A.
The contents of carry flag CY remains unchanged.
Skips the next instruction when there is no overflow as the result of operation.
Executes the next instruction when there is overflow as the result of operation.

AM (Add accumulator and Memory)

Instruction code

D9									D0				
0	0	0	0	0	0	1	0	1	0	2	0 0 A	16	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (A) + (M(DP))

Grouping: Arithmetic operation

Description: Adds the contents of M(DP) to register A. Stores the result in register A. The contents of carry flag CY remains unchanged.

AMC (Add accumulator, Memory and Carry)

Instruction code

D9									D0				
0	0	0	0	0	0	1	0	1	1	2	0 0 B	16	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	0/1	–

Operation: (A) ← (A) + (M(DP)) + (CY)
(CY) ← Carry

Grouping: Arithmetic operation

Description: Adds the contents of M(DP) and carry flag CY to register A. Stores the result in register A and carry flag CY.

AND (logical AND between accumulator and memory)

Instruction code

D9									D0				
0	0	0	0	0	1	1	0	0	0	2	0 1 8	16	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (A) AND (M(DP))

Grouping: Arithmetic operation

Description: Takes the AND operation between the contents of register A and the contents of M(DP), and stores the result in register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

B a (Branch to address a)

Instruction code

D9									D0				
0	1	1	a6	a5	a4	a3	a2	a1	a0	$_2$	1	8 +a	a	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PCL) ← a6 to a0

Grouping: Branch operation

Description: Branch within a page : Branches to address a in the identical page.

Note: Specify the branch address within the page including this instruction.

BL p, a (Branch Long to address a in page p)

Instruction code

D9									D0				
0	0	1	1	1	p4	p3	p2	p1	p0	$_2$	0	E +p	p	$_{16}$
1	p6	p5	a6	a5	a4	a3	a2	a1	a0	$_2$	2 +p	p +a	a	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	–

Operation: (PCH) ← p
(PCL) ← a6 to a0

Grouping: Branch operation

Description: Branch out of a page : Branches to address a in page p.

Note: p is 0 to 63 for M34554M8, and p is 0 to 95 for M34554MC, and p is 0 to 127 for M34554ED.

BLA p (Branch Long to address (D) + (A) in page p)

Instruction code

D9									D0				
0	0	0	0	0	1	0	0	0	0	$_2$	0	1	0	$_{16}$
1	p6	p5	p4	0	0	p3	p2	p1	p0	$_2$	2 +p	p	p	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	–

Operation: (PCH) ← p
(PCL) ← (DR2–DR0, A3–A0)

Grouping: Branch operation

Description: Branch out of a page : Branches to address (DR2 DR1 DR0 A3 A2 A1 A0)2 specified by registers D and A in page p.

Note: p is 0 to 63 for M34554M8, and p is 0 to 95 for M34554MC, and p is 0 to 127 for M34554ED.

BM a (Branch and Mark to address a in page 2)

Instruction code

D9									D0				
0	1	0	a6	a5	a4	a3	a2	a1	a0	$_2$	1	a	a	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (SP) ← (SP) + 1
(SK(SP)) ← (PC)
(PCH) ← 2
(PCL) ← a6–a0

Grouping: Subroutine call operation

Description: Call the subroutine in page 2 : Calls the subroutine at address a in page 2.

Note: Subroutine extending from page 2 to another page can also be called with the BM instruction when it starts on page 2.
Be careful not to over the stack because the maximum level of subroutine nesting is 8.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

BML p, a (Branch and Mark Long to address a in page p)

Instruction code

D9									D0			
0	0	1	1	0	p4	p3	p2	p1	p0	2	0	C+p	p	16
1	p6	p5	a6	a5	a4	a3	a2	a1	a0	2	2+p	p+a	a	16

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	–

Grouping: Subroutine call operation

Operation:
(SP) ← (SP) + 1
(SK(SP)) ← (PC)
(PC_H) ← p
(PC_L) ← a_6–a_0

Description: Call the subroutine : Calls the subroutine at address a in page p.

Note: p is 0 to 63 for M34554M8, and p is 0 to 95 for M34554MC, and p is 0 to 127 for M34554ED.
Be careful not to over the stack because the maximum level of subroutine nesting is 8.

BMLA p (Branch and Mark Long to address (D) + (A) in page p)

Instruction code

D9									D0			
0	0	0	0	1	1	0	0	0	0	2	0	3	0	16
1	p6	p5	p4	0	0	p3	p2	p1	p0	2	2+p	p	p	16

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	–

Grouping: Subroutine call operation

Operation:
(SP) ← (SP) + 1
(SK(SP)) ← (PC)
(PC_H) ← p
(PC_L) ← (DR_2–DR_0, A_3–A_0)

Description: Call the subroutine : Calls the subroutine at address (DR_2 DR_1 DR_0 A_3 A_2 A_1 A_0)$_2$ specified by registers D and A in page p.

Note: p is 0 to 63 for M34554M8, and p is 0 to 95 for M34554MC, and p is 0 to 127 for M34554ED.
Be careful not to over the stack because the maximum level of subroutine nesting is 8.

CLD (CLear port D)

Instruction code

D9									D0				
0	0	0	0	0	1	0	0	0	1	2	0	1	1	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Grouping: Input/Output operation

Operation: (D) ← 1

Description: Sets (1) to port D.

CMA (CoMplement of Accumulator)

Instruction code

D9									D0				
0	0	0	0	0	1	1	1	0	0	2	0	1	C	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Grouping: Arithmetic operation

Operation: (A) ← $\overline{(A)}$

Description: Stores the one's complement for register A's contents in register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

CMCK (Clock select: ceraMic oscillation ClocK)

Instruction code

D9									D0				
1	0	1	0	0	1	1	0	1	0	2	9	A	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: Ceramic oscillation circuit selected

Grouping: Other operation

Description: Selects the ceramic oscillation circuit and stops the on-chip oscillator.

CRCK (Clock select: Rc oscillation ClocK)

Instruction code

D9									D0				
1	0	1	0	0	1	1	0	1	1	2	9	B	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: RC oscillation circuit selected

Grouping: Other operation

Description: Selects the RC oscillation circuit and stops the on-chip oscillator.

DEY (DEcrement register Y)

Instruction code

D9									D0				
0	0	0	0	0	1	0	1	1	1	0	1	7	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(Y) = 15

Operation: (Y) ← (Y) – 1

Grouping: RAM addresses

Description: Subtracts 1 from the contents of register Y. As a result of subtraction, when the contents of register Y is 15, the next instruction is skipped. When the contents of register Y is not 15, the next instruction is executed.

DI (Disable Interrupt)

Instruction code

D9									D0				
0	0	0	0	0	0	0	1	0	0	0	0	4	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (INTE) ← 0

Grouping: Interrupt control operation

Description: Clears (0) to interrupt enable flag INTE, and disables the interrupt.

Note: Interrupt is disabled by executing the DI instruction after executing 1 machine cycle.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

DWDT (Disable WatchDog Timer)

Instruction code

D9									D0				
1	0	1	0	0	1	1	1	0	0	2	9	C	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: Stop of watchdog timer function enabled

Grouping: Other operation

Description: Stops the watchdog timer function by the WRST instruction after executing the DWDT instruction.

EI (Enable Interrupt)

Instruction code

D9									D0				
0	0	0	0	0	0	0	1	0	1	0	0	5	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (INTE) ← 1

Grouping: Interrupt control operation

Description: Sets (1) to interrupt enable flag INTE, and enables the interrupt.

Note: Interrupt is enabled by executing the EI instruction after executing 1 machine cycle.

EPOF (Enable POF instruction)

Instruction code

D9									D0				
0	0	0	1	0	1	1	0	1	1	0	5	B	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: POF instruction, POF2 instruction valid

Grouping: Other operation

Description: Makes the immediate after POF or POF2 instruction valid by executing the EPOF instruction.

IAP0 (Input Accumulator from port P0)

Instruction code

D9									D0				
1	0	0	1	1	0	0	0	0	0	2	6	0	16
									2				

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (P0)

Grouping: Input/Output operation

Description: Transfers the input of port P0 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

IAP1 (Input Accumulator from port P1)

Instruction code

D9									D0				
1	0	0	1	1	0	0	0	0	1	$_2$	2 6 1	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (P1)

Grouping: Input/Output operation

Description: Transfers the input of port P1 to register A.

IAP2 (Input Accumulator from port P2)

Instruction code

D9									D0				
1	0	0	1	1	0	0	0	1	0	$_2$	2 6 2	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (P2)

Grouping: Input/Output operation

Description: Transfers the input of port P2 to register A.

IAP3 (Input Accumulator from port P3)

Instruction code

D9									D0				
1	0	0	1	1	0	0	0	1	1	$_2$	2 6 3	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (P3)

Grouping: Input/Output operation

Description: Transfers the input of port P3 to register A.

INY (INcrement register Y)

Instruction code

D9									D0				
0	0	0	0	0	1	0	0	1	1	$_2$	0 1 3	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(Y) = 0

Operation: (Y) ← (Y) + 1

Grouping: RAM addresses

Description: Adds 1 to the contents of register Y. As a result of addition, when the contents of register Y is 0, the next instruction is skipped. When the contents of register Y is not 0, the next instruction is executed.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

LA n (Load n in Accumulator)

Instruction code

D9									D0			
0	0	0	1	1	1	n	n	n	n	0	7	n
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	Continuous description

Operation: (A) ← n
n = 0 to 15

Grouping: Arithmetic operation

Description: Loads the value n in the immediate field to register A.
When the LA instructions are continuously coded and executed, only the first LA instruction is executed and other LA instructions coded continuously are skipped.

LXY x, y (Load register X and Y with x and y)

Instruction code

D9									D0			
1	1	x_3	x_2	x_1	x_0	y_3	y_2	y_1	y_0	3	x	y
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	Continuous description

Operation: (X) ← x x = 0 to 15
(Y) ← y y = 0 to 15

Grouping: RAM addresses

Description: Loads the value x in the immediate field to register X, and the value y in the immediate field to register Y. When the LXY instructions are continuously coded and executed, only the first LXY instruction is executed and other LXY instructions coded continuously are skipped.

LZ z (Load register Z with z)

Instruction code

D9									D0			
0	0	0	1	0	0	1	0	z_1	z_0	0	4	8 +z
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (Z) ← z z = 0 to 3

Grouping: RAM addresses

Description: Loads the value z in the immediate field to register Z.

NOP (No OPeration)

Instruction code

D9									D0			
0	0	0	0	0	0	0	0	0	0	0	0	0
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PC) ← (PC) + 1

Grouping: Other operation

Description: No operation; Adds 1 to program counter value, and others remain unchanged.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

OP0A (Output port P0 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	1	0	0	0	0	0	2	2	0	
									2				16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (P0) ← (A)

Grouping: Input/Output operation

Description: Outputs the contents of register A to port P0.

OP1A (Output port P1 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	1	0	0	0	0	1	2	2	1	
									2				16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (P1) ← (A)

Grouping: Input/Output operation

Description: Outputs the contents of register A to port P1.

OR (logical OR between accumulator and memory)

Instruction code

D9									D0				
0	0	0	0	0	1	1	0	0	1	0	1	9	
									2				16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (A) OR (M(DP))

Grouping: Arithmetic operation

Description: Takes the OR operation between the contents of register A and the contents of M(DP), and stores the result in register A.

POF (Power OFf1)

Instruction code

D9									D0				
0	0	0	0	0	0	0	0	1	0	0	0	2	
									2				16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: Transition to clock operating mode

Grouping: Other operation

Description: Puts the system in clock operating state by executing the POF instruction after executing the EPOF instruction.

Note: If the EPOF instruction is not executed before executing this instruction, this instruction is equivalent to the NOP instruction.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

POF2 (Power OFf2)

Instruction code

D9									D0				
0	0	0	0	0	0	1	0	0	0	2	0	0	8	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: Transition to RAM back-up mode

Grouping: Other operation

Description: Puts the system in RAM back-up state by executing the POF2 instruction after executing the EPOF instruction.

Note: If the EPOF instruction is not executed before executing this instruction, this instruction is equivalent to the NOP instruction.

RAR (Rotate Accumulator Right)

Instruction code

D9									D0				
0	0	0	0	0	1	1	1	0	1	2	0	1	D	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	0/1	–

Operation: $\rightarrow$[CY]$\rightarrow$[$A_3A_2A_1A_0$]

Grouping: Arithmetic operation

Description: Rotates 1 bit of the contents of register A including the contents of carry flag CY to the right.

RB j (Reset Bit)

Instruction code

D9									D0				
0	0	0	1	0	0	1	1	j	j	2	0	4	C+j	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (Mj(DP)) $\leftarrow$ 0
j = 0 to 3

Grouping: Bit operation

Description: Clears (0) the contents of bit j (bit specified by the value j in the immediate field) of M(DP).

RBK (Reset Bank flag)

Instruction code

D9									D0				
0	0	0	1	0	0	0	0	0	0	2	0	4	0	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: When TABP p instruction is executed, $P_6 \leftarrow 0$

Grouping: Other operation

Description: Sets referring data area to pages 0 to 63 when the TABP p instruction is executed.

Note: This instruction cannot be used in M34554M8.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

RC (Reset Carry flag)

Instruction code

D9									D0			
0	0	0	0	0	0	0	1	1	0	0	0	6

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	0	–

Operation: (CY) ← 0

Grouping: Arithmetic operation

Description: Clears (0) to carry flag CY.

RCP (Reset Port C)

Instruction code

D9									D0			
1	0	1	0	0	0	1	1	0	0	2	8	C

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (C) ← 0

Grouping: Input/Output operation

Description: Clears (0) to port C.

RD (Reset port D specified by register Y)

Instruction code

D9									D0			
0	0	0	0	0	1	0	1	0	0	0	1	4

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (D(Y)) ← 0
However,
(Y) = 0 to 9

Grouping: Input/Output operation

Description: Clears (0) to a bit of port D specified by register Y.

RT (ReTurn from subroutine)

Instruction code

D9									D0			
0	0	0	1	0	0	0	1	0	0	0	4	4

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	2	–	–

Operation: (PC) ← (SK(SP))
(SP) ← (SP) – 1

Grouping: Return operation

Description: Returns from subroutine to the routine called the subroutine.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

RTI (ReTurn from Interrupt)

Instruction code

D9									D0				
0	0	0	1	0	0	0	1	1	0	$_2$	0 4 6	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PC) ← (SK(SP))
(SP) ← (SP) – 1

Grouping: Return operation

Description: Returns from interrupt service routine to main routine.
Returns each value of data pointer (X, Y, Z), carry flag, skip status, NOP mode status by the continuous description of the LA/LXY instruction, register A and register B to the states just before interrupt.

RTS (ReTurn from subroutine and Skip)

Instruction code

D9									D0				
0	0	0	1	0	0	0	1	0	1	$_2$	0 4 5	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	2	–	Skip at uncondition

Operation: (PC) ← (SK(SP))
(SP) ← (SP) – 1

Grouping: Return operation

Description: Returns from subroutine to the routine called the subroutine, and skips the next instruction at uncondition.

SB j (Set Bit)

Instruction code

D9									D0				
0	0	0	1	0	1	1	1	j	j	$_2$	0 5	C+j	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (Mj(DP)) ← 1
j = 0 to 3

Grouping: Bit operation

Description: Sets (1) the contents of bit j (bit specified by the value j in the immediate field) of M(DP).

SBK (Set Bank flag)

Instruction code

D9									D0				
0	0	0	1	0	0	0	0	0	1	$_2$	0 4 1	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: When TABP p instruction is executed, P_6 ← 1

Grouping: Other operation

Description: Sets referring data area to pages 64 to 127 when the TABP p instruction is executed.

Note: This instruction cannot be used in M34554M8.
In M34554MC, referring data area is pages 64 to 95.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

SC (Set Carry flag)

Instruction code

D9									D0			
0	0	0	0	0	0	0	1	1	1	0	0	7
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	1	–

Operation: (CY) ← 1

Grouping: Arithmetic operation

Description: Sets (1) to carry flag CY.

SCP (Set Port C)

Instruction code

D9									D0			
1	0	1	0	0	0	1	1	0	1	2	8	D
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (C) ← 1

Grouping: Input/Output operation

Description: Sets (1) to port C.

SD (Set port D specified by register Y)

Instruction code

D9									D0			
0	0	0	0	0	1	0	1	0	1	0	1	5
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (D(Y)) ← 1
(Y) = 0 to 9

Grouping: Input/Output operation

Description: Sets (1) to a bit of port D specified by register Y.

SEA n (Skip Equal, Accumulator with immediate data n)

Instruction code

D9									D0			
0	0	0	0	1	0	0	1	0	1	0	2	5
$_2$										$_{16}$		
0	0	0	1	1	1	n	n	n	n	0	7	n
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	(A) = n

Operation: (A) = n ?
n = 0 to 15

Grouping: Comparison operation

Description: Skips the next instruction when the contents of register A is equal to the value n in the immediate field.
Executes the next instruction when the contents of register A is not equal to the value n in the immediate field.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

SEAM (Skip Equal, Accumulator with Memory)

Instruction code

D9									D0				
0	0	0	0	1	0	0	1	1	0	2	0	2	6	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(A) = (M(DP))

Operation: (A) = (M(DP)) ?

Grouping: Comparison operation

Description: Skips the next instruction when the contents of register A is equal to the contents of M(DP).
Executes the next instruction when the contents of register A is not equal to the contents of M(DP).

SNZ0 (Skip if Non Zero condition of external 0 interrupt request flag)

Instruction code

D9									D0				
0	0	0	0	1	1	1	0	0	0	2	0	3	8	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V1_0$ = 0: (EXF0) = 1

Operation:
$V1_0$ = 0: (EXF0) = 1 ?
After skipping, (EXF0) ← 0
$V1_0$ = 1: SNZ0 = NOP
($V1_0$: bit 0 of the interrupt control register V1)

Grouping: Interrupt operation

Description: When $V1_0$ = 0 : Skips the next instruction when external 0 interrupt request flag EXF0 is “1.” After skipping, clears (0) to the EXF0 flag. When the EXF0 flag is “0,” executes the next instruction.
When $V1_0$ = 1 : This instruction is equivalent to the NOP instruction.

SNZ1 (Skip if Non Zero condition of external 1 interrupt request flag)

Instruction code

D9									D0				
0	0	0	0	1	1	1	0	0	1	2	0	3	9	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V1_1$ = 0: (EXF1) = 1

Operation:
$V1_1$ = 0: (EXF1) = 1 ?
After skipping, (EXF1) ← 0
$V1_1$ = 1: SNZ1 = NOP
($V1_1$: bit 1 of the interrupt control register V1)

Grouping: Interrupt operation

Description: When $V1_1$ = 0 : Skips the next instruction when external 1 interrupt request flag EXF1 is “1.” After skipping, clears (0) to the EXF1 flag. When the EXF1 flag is “0,” executes the next instruction.
When $V1_1$ = 1 : This instruction is equivalent to the NOP instruction.

SNZI0 (Skip if Non Zero condition of external 0 Interrupt input pin)

Instruction code

D9									D0				
0	0	0	0	1	1	1	0	1	0	2	0	3	A	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$I1_2$ = 0 : (INT0) = “L” $I1_2$ = 1 : (INT0) = “H”

Operation:
$I1_2$ = 0 : (INT0) = “L” ?
$I1_2$ = 1 : (INT0) = “H” ?
($I1_2$: bit 2 of the interrupt control register I1)

Grouping: Interrupt operation

Description: When $I1_2$ = 0 : Skips the next instruction when the level of INT0 pin is “L.” Executes the next instruction when the level of INT0 pin is “H.”
When $I1_2$ = 1 : Skips the next instruction when the level of INT0 pin is “H.” Executes the next instruction when the level of INT0 pin is “L.”

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

SNZI1 (Skip if Non Zero condition of external 1 Interrupt input pin)

Instruction code

D9									D0	
0	0	0	0	1	1	1	0	1	1	$_2$

0	3	B	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$I2_2$ = 0 : (INT1) = “L” $I2_2$ = 1 : (INT1) = “H”

Operation:
$I2_2$ = 0 : (INT1) = “L” ?
$I2_2$ = 1 : (INT1) = “H” ?
($I2_2$: bit 2 of the interrupt control register I2)

Grouping: Interrupt operation

Description: When $I2_2$ = 0 : Skips the next instruction when the level of INT1 pin is “L.” Executes the next instruction when the level of INT1 pin is “H.”
When $I2_2$ = 1 : Skips the next instruction when the level of INT1 pin is “H.” Executes the next instruction when the level of INT1 pin is “L.”

SNZP (Skip if Non Zero condition of Power down flag)

Instruction code

D9									D0	
0	0	0	0	0	0	0	0	1	1	$_2$

0	0	3	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(P) = 1

Operation: (P) = 1 ?

Grouping: Other operation

Description: Skips the next instruction when the P flag is “1”.
After skipping, the P flag remains unchanged.
Executes the next instruction when the P flag is “0.”

SNZT1 (Skip if Non Zero condition of Timer 1 interrupt request flag)

Instruction code

D9									D0	
1	0	1	0	0	0	0	0	0	0	$_2$

2	8	0	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V1_2$ = 0: (T1F) = 1

Operation:
$V1_2$ = 0: (T1F) = 1 ?
After skipping, (T1F) ← 0
$V1_2$ = 1: SNZT1 = NOP
($V1_2$ = bit 2 of interrupt control register V1)

Grouping: Timer operation

Description: When $V1_2$ = 0 : Skips the next instruction when timer 1 interrupt request flag T1F is “1.” After skipping, clears (0) to the T1F flag. When the T1F flag is “0,” executes the next instruction.
When $V1_2$ = 1 : This instruction is equivalent to the NOP instruction.

SNZT2 (Skip if Non Zero condition of Timer 2 interrupt request flag)

Instruction code

D9									D0	
1	0	1	0	0	0	0	0	0	1	$_2$

2	8	1	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V1_3$ = 0: (T2F) = 1

Operation:
$V1_3$ = 0: (T2F) = 1 ?
After skipping, (T2F) ← 0
$V1_3$ = 1: SNZT2 = NOP
($V1_3$ = bit 3 of interrupt control register V1)

Grouping: Timer operation

Description: When $V1_3$ = 0 : Skips the next instruction when timer 2 interrupt request flag T2F is “1.” After skipping, clears (0) to the T2F flag. When the T2F flag is “0,” executes the next instruction.
When $V1_3$ = 1 : This instruction is equivalent to the NOP instruction.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

SNZT3 (Skip if Non Zero condition of Timer 3 interrupt request flag)

Instruction code

D9									D0	
1	0	1	0	0	0	0	0	1	0	$_2$

2	8	2	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V2_0$ = 0: (T3F) = 1

Operation: $V2_0$ = 0: (T3F) = 1 ?
After skipping, (T3F) ← 0
$V2_0$ = 1: SNZT3 = NOP
($V2_0$ = bit 0 of interrupt control register V2)

Grouping: Timer operation

Description: When $V2_0$ = 0 : Skips the next instruction when timer 3 interrupt request flag T3F is "1." After skipping, clears (0) to the T3F flag. When the T3F flag is "0," executes the next instruction.
When $V2_0$ = 1 : This instruction is equivalent to the NOP instruction.

SNZT4 (Skip if Non Zero condition of Timer 4 inerrupt request flag)

Instruction code

D9									D0	
1	0	1	0	0	0	0	0	1	1	$_2$

2	8	3	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V2_3$ = 0: (T4F) = 1

Operation: $V2_3$ = 0: (T4F) = 1 ?
After skipping, (T4F) ← 0
$V2_3$ = 1: SNZT4 = NOP
($V2_3$ = bit 3 of interrupt control register V2)

Grouping: Timer operation

Description: When $V2_3$ = 0 : Skips the next instruction when timer 4 interrupt request flag T4F is "1." After skipping, clears (0) to the T4F flag. When the T4F flag is "0," executes the next instruction.
When $V2_3$ = 1 : This instruction is equivalent to the NOP instruction.

SNZT5 (Skip if Non Zero condition of Timer 5 inerrupt request flag)

Instruction code

D9									D0	
1	0	1	0	0	0	0	1	0	0	$_2$

2	8	4	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	$V2_1$ = 0: (T5F) = 1

Operation: $V2_1$ = 0: (T5F) = 1 ?
After skipping, (T5F) ← 0
$V2_1$ = 1: SNZT5 = NOP
($V2_1$ = bit 1 of interrupt control register V2)

Grouping: Timer operation

Description: When $V2_1$ = 0 : Skips the next instruction when timer 5 interrupt request flag T5F is "1." After skipping, clears (0) to the T5F flag. When the T5F flag is "0," executes the next instruction.
When $V2_1$ = 1 : This instruction is equivalent to the NOP instruction.

SVDE (Set Voltage Detector Enable flag)

Instruction code

D9									D0	
1	0	1	0	0	1	0	0	1	1	$_2$

2	9	3	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: At power down mode, voltage drop detection circuit valid

Grouping: Other operation

Description: Validates the voltage drop detection circuit at power down (clock operating mode and RAM back-up mode) when VDCE pin is "H".

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

SZB j (Skip if Zero, Bit)

Instruction code

D9									D0				
0	0	0	0	1	0	0	0	j	j	$_2$	0 2 j	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(Mj(DP)) = 0 j = 0 to 3

Operation: (Mj(DP)) = 0 ?
j = 0 to 3

Grouping: Bit operation

Description: Skips the next instruction when the contents of bit j (bit specified by the value j in the immediate field) of M(DP) is “0.”
Executes the next instruction when the contents of bit j of M(DP) is “1.”

SZC (Skip if Zero, Carry flag)

Instruction code

D9									D0				
0	0	0	0	1	0	1	1	1	1	$_2$	0 2 F	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(CY) = 0

Operation: (CY) = 0 ?

Grouping: Arithmetic operation

Description: Skips the next instruction when the contents of carry flag CY is “0.”
After skipping, the CY flag remains unchanged.
Executes the next instruction when the contents of the CY flag is “1.“

SZD (Skip if Zero, port D specified by register Y)

Instruction code

D9									D0				
0	0	0	0	1	0	0	1	0	0	$_2$	0 2 4	$_{16}$	
0	0	0	0	1	0	1	0	1	1	$_2$	0 2 B	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
2	2	–	(D(Y)) = 0 (Y) = 0 to 7

Operation: (D(Y)) = 0 ?
(Y) = 0 to 7

Grouping: Input/Output operation

Description: Skips the next instruction when a bit of port D specified by register Y is “0.” Executes the next instruction when the bit is “1.”

T1AB (Transfer data to timer 1 and register R1 from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	0	0	0	0	$_2$	2 3 0	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: ($T1_7$–$T1_4$) ← (B)
($R1_7$–$R1_4$) ← (B)
($T1_3$–$T1_0$) ← (A)
($R1_3$–$R1_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of timer 1 and timer 1 reload register R1. Transfers the contents of register A to the low-order 4 bits of timer 1 and timer 1 reload register R1.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

T2AB (Transfer data to timer 2 and register R2 from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	0	0	0	1	$_2$	2 3 1	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(T2$_7$–T2$_4$) ← (B)
(R2$_7$–R2$_4$) ← (B)
(T2$_3$–T2$_0$) ← (A)
(R2$_3$–R2$_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of timer 2 and timer 2 reload register R2. Transfers the contents of register A to the low-order 4 bits of timer 2 and timer 2 reload register R2.

T3AB (Transfer data to timer 3 and register R3 from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	0	0	1	0	$_2$	2 3 2	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(T3$_7$–T3$_4$) ← (B)
(R3$_7$–R3$_4$) ← (B)
(T3$_3$–T3$_0$) ← (A)
(R3$_3$–R3$_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of timer 3 and timer 3 reload register R3. Transfers the contents of register A to the low-order 4 bits of timer 3 and timer 3 reload register R3.

T4AB (Transfer data to timer 4 and register R4L from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	0	0	1	1	$_2$	2 3 3	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(T4$_7$–T4$_4$) ← (B)
(R4L$_7$–R4L$_4$) ← (B)
(T4$_3$–T4$_0$) ← (A)
(R4L$_3$–R4L$_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of timer 4 and timer 4 reload register R4L. Transfers the contents of register A to the low-order 4 bits of timer 4 and timer 4 reload register R4L.

T4HAB (Transfer data to register R4H from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	0	1	1	1	$_2$	2 3 7	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(R4H$_7$–R4H$_4$) ← (B)
(R4H$_3$–R4H$_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of timer 4 and timer 4 reload register R4H. Transfers the contents of register A to the low-order 4 bits of timer 4 and timer 4 reload register R4H.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

T4R4L (Transfer data to timer 4 from register R4L)

Instruction code

D9									D0			
1	0	1	0	0	1	0	1	1	1	2	9	7

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (T4$_7$–T4$_4$) ← (R4L$_7$–R4L$_4$)
(T4$_3$–T4$_0$) ← (R4L$_3$–R4L$_0$)

Grouping: Timer operation

Description: Transfers the contents of reload register R4L to timer 4.

TAB (Transfer data to Accumulator from register B)

Instruction code

D9									D0			
0	0	0	0	0	1	1	1	1	0	0	1	E

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (B)

Grouping: Register to register transfer

Description: Transfers the contents of register B to register A.

TAB1 (Transfer data to Accumulator and register B from timer 1)

Instruction code

D9									D0			
1	0	0	1	1	1	0	0	0	0	2	7	0

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (B) ← (T1$_7$–T1$_4$)
(A) ← (T1$_3$–T1$_0$)

Grouping: Timer operation

Description: Transfers the high-order 4 bits (T1$_7$–T1$_4$) of timer 1 to register B.
Transfers the low-order 4 bits (T1$_3$–T1$_0$) of timer 1 to register A.

TAB2 (Transfer data to Accumulator and register B from timer 2)

Instruction code

D9									D0			
1	0	0	1	1	1	0	0	0	1	2	7	1

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (B) ← (T2$_7$–T2$_4$)
(A) ← (T2$_3$–T2$_0$)

Grouping: Timer operation

Description: Transfers the high-order 4 bits (T2$_7$–T2$_4$) of timer 2 to register B.
Transfers the low-order 4 bits (T2$_3$–T2$_0$) of timer 2 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TAB3 (Transfer data to Accumulator and register B from timer 3)

Instruction code

D9									D0			
1	0	0	1	1	1	0	0	1	0	2	7	2
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(B) ← ($T3_7$–$T3_4$)
(A) ← ($T3_3$–$T3_0$)

Grouping: Timer operation

Description: Transfers the high-order 4 bits ($T3_7$–$T3_4$) of timer 3 to register B.
Transfers the low-order 4 bits ($T3_3$–$T3_0$) of timer 3 to register A.

TAB4 (Transfer data to Accumulator and register B from timer 4)

Instruction code

D9									D0			
1	0	0	1	1	1	0	0	1	1	2	7	3
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(B) ← ($T4_7$–$T4_4$)
(A) ← ($T4_3$–$T4_0$)

Grouping: Timer operation

Description: Transfers the high-order 4 bits ($T4_7$–$T4_4$) of timer 4 to register B.
Transfers the low-order 4 bits ($T4_3$–$T4_0$) of timer 4 to register A.

TABE (Transfer data to Accumulator and register B from register E)

Instruction code

D9									D0			
0	0	0	0	1	0	1	0	1	0	0	2	A
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(B) ← (E_7–E_4)
(A) ← (E_3–E_0)

Grouping: Register to register transfer

Description: Transfers the high-order 4 bits (E_7–E_4) of register E to register B, and low-order 4 bits of register E to register A.

TABP p (Transfer data to Accumulator and register B from Program memory in page p)

Instruction code

D9									D0			
0	0	1	0	p_5	p_4	p_3	p_2	p_1	p_0	0	8 +p	p
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	3	–	–

Operation:
(SP) ← (SP) + 1
(SK(SP)) ← (PC)
(PC_H) ← p
(PC_L) ← (DR_2–DR_0, A_3–A_0)
(B) ← (ROM(PC))$_{7–4}$
(A) ← (ROM(PC))$_{3–0}$
(PC) ← (SK(SP))
(SP) ← (SP) – 1

Grouping: Arithmetic operation

Description: Transfers bits 7 to 4 to register B and bits 3 to 0 to register A. These bits 7 to 0 are the ROM pattern in address (DR_2 DR_1 DR_0 A_3 A_2 A_1 A_0)$_2$ specified by registers A and D in page p.
The pages which can be referred as follows;
after the SBK instruction: 64 to 127
after the RBK instruction: 0 to 63
after system is released from reset or returned from power down: 0 to 63.

Note: p is 0 to 63 for M34554M8, and p is 0 to 95 for M34554MC, and p is 0 to 127 for M34554ED. When this instruction is executed, be careful not to over the stack because 1 stage of stack register is used.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TABPS (Transfer data to Accumulator and register B from PreScaler)

Instruction code

D9									D0				
1	0	0	1	1	1	0	1	0	1	2	7	5	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (B) ← (TPS_7–TPS_4)
(A) ← (TPS_3–TPS_0)

Grouping: Timer operation

Description: Transfers the high-order 4 bits (TPS_7–TPS_4) of prescaler to register B, and transfers the low-order 4 bits (TPS_3–TPS_0) of prescaler to register A.

TAD (Transfer data to Accumulator from register D)

Instruction code

D9									D0				
0	0	0	1	0	1	0	0	0	1	0	5	1	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A_2–A_0) ← (DR_2–DR_0)
(A_3) ← 0

Grouping: Register to register transfer

Description: Transfers the contents of register D to the low-order 3 bits (A_2–A_0) of register A.

Note: When this instruction is executed, “0” is stored to the bit 3 (A_3) of register A.

TAI1 (Transfer data to Accumulator from register I1)

Instruction code

D9									D0				
1	0	0	1	0	1	0	0	1	1	2	5	3	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (I1)

Grouping: Interrupt operation

Description: Transfers the contents of interrupt control register I1 to register A.

TAI2 (Transfer data to Accumulator from register I2)

Instruction code

D9									D0				
1	0	0	1	0	1	0	1	0	0	2	5	4	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (I2)

Grouping: Interrupt operation

Description: Transfers the contents of interrupt control register I2 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TAK0 (Transfer data to Accumulator from register K0)

Instruction code

D9									D0				
1	0	0	1	0	1	0	1	1	0	2	5	6	16
2													

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (K0)

Grouping: Input/Output operation

Description: Transfers the contents of key-on wakeup control register K0 to register A.

TAK1 (Transfer data to Accumulator from register K1)

Instruction code

D9									D0				
1	0	0	1	0	1	1	0	0	1	2	5	9	16
2													

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (K1)

Grouping: Input/Output operation

Description: Transfers the contents of key-on wakeup control register K1 to register A.

TAK2 (Transfer data to Accumulator from register K2)

Instruction code

D9									D0				
1	0	0	1	0	1	1	0	1	0	2	5	A	16
2													

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (K2)

Grouping: Input/Output operation

Description: Transfers the contents of key-on wakeup control register K2 to register A.

TAL1 (Transfer data to Accumulator from register L1)

Instruction code

D9									D0				
1	0	0	1	0	0	1	0	1	0	2	4	A	16
2													

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (L1)

Grouping: LCD control operation

Description: Transfers the LCD control register L1 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TAM j (Transfer data to Accumulator from Memory)

Instruction code

D9									D0			
1	0	1	1	0	0	j	j	j	j	2	C	j
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (M(DP))
(X) ← (X)EXOR(j)
j = 0 to 15

Grouping: RAM to register transfer

Description: After transferring the contents of M(DP) to register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.

TAMR (Transfer data to Accumulator from register MR)

Instruction code

D9									D0			
1	0	0	1	0	1	0	0	1	0	2	5	2
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (MR)

Grouping: Clock operation

Description: Transfers the contents of clock control register MR to register A.

TAPU0 (Transfer data to Accumulator from register PU0)

Instruction code

D9									D0			
1	0	0	1	0	1	0	1	1	1	2	5	7
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (PU0)

Grouping: Input/Output operation

Description: Transfers the contents of pull-up control register PU0 to register A.

TAPU1 (Transfer data to Accumulator from register PU1)

Instruction code

D9									D0			
1	0	0	1	0	1	1	1	1	0	2	5	E
$_2$										$_{16}$		

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (PU1)

Grouping: Input/Output operation

Description: Transfers the contents of pull-up control register PU1 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TASP (Transfer data to Accumulator from Stack Pointer)

Instruction code

D9									D0				
0	0	0	1	0	1	0	0	0	0	$_2$	0 5 0	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: $(A_2–A_0) \leftarrow (SP_2–SP_0)$
$(A_3) \leftarrow 0$

Grouping: Register to register transfer

Description: Transfers the contents of stack pointer (SP) to the low-order 3 bits ($A_2–A_0$) of register A.

Note: After this instruction is executed, "0" is stored to the bit 3 (A_3) of register A.

TAV1 (Transfer data to Accumulator from register V1)

Instruction code

D9									D0				
0	0	0	1	0	1	0	1	0	0	$_2$	0 5 4	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (V1)

Grouping: Interrupt operation

Description: Transfers the contents of interrupt control register V1 to register A.

TAV2 (Transfer data to Accumulator from register V2)

Instruction code

D9									D0				
0	0	0	1	0	1	0	1	0	1	$_2$	0 5 5	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (V2)

Grouping: Interrupt operation

Description: Transfers the contents of interrupt control register V2 to register A.

TAW1 (Transfer data to Accumulator from register W1)

Instruction code

D9									D0				
1	0	0	1	0	0	1	0	1	1	$_2$	2 4 B	$_{16}$	

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W1)

Grouping: Timer operation

Description: Transfers the contents of timer control register W1 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TAW2 (Transfer data to Accumulator from register W2)

Instruction code

D9									D0				
1	0	0	1	0	0	1	1	0	0	2	4	C	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W2)

Grouping: Timer operation

Description: Transfers the contents of timer control register W2 to register A.

TAW3 (Transfer data to Accumulator from register W3)

Instruction code

D9									D0				
1	0	0	1	0	0	1	1	0	1	2	4	D	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W3)

Grouping: Timer operation

Description: Transfers the contents of timer control register W3 to register A.

TAW4 (Transfer data to Accumulator from register W4)

Instruction code

D9									D0				
1	0	0	1	0	0	1	1	1	0	2	4	E	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W4)

Grouping: Timer operation

Description: Transfers the contents of timer control register W4 to register A.

TAW5 (Transfer data to Accumulator from register W5)

Instruction code

D9									D0				
1	0	0	1	0	0	1	1	1	1	2	4	F	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W5)

Grouping: Timer operation

Description: Transfers the contents of timer control register W5 to register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TAW6 (Transfer data to Accumulator from register W6)

Instruction code

D9									D0				
1	0	0	1	0	1	0	0	0	0	$_2$	2	5	0	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (W6)

Grouping: Timer operation

Description: Transfers the contents of timer control register W6 to register A.

TAX (Transfer data to Accumulator from register X)

Instruction code

D9									D0				
0	0	0	1	0	1	0	0	1	0	$_2$	0	5	2	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (X)

Grouping: Register to register transfer

Description: Transfers the contents of register X to register A.

TAY (Transfer data to Accumulator from register Y)

Instruction code

D9									D0				
0	0	0	0	0	1	1	1	1	1	$_2$	0	1	F	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ← (Y)

Grouping: Register to register transfer

Description: Transfers the contents of register Y to register A.

TAZ (Transfer data to Accumulator from register Z)

Instruction code

D9									D0				
0	0	0	1	0	1	0	0	1	1	$_2$	0	5	3	$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A_1, A_0) ← (Z_1, Z_0)
(A_3, A_2) ← 0

Grouping: Register to register transfer

Description: Transfers the contents of register Z to the low-order 2 bits (A_1, A_0) of register A.

Note: After this instruction is executed, "0" is stored to the high-order 2 bits (A_3, A_2) of register A.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TBA (Transfer data to register B from Accumulator)

Instruction code

D9									D0				
0	0	0	0	0	0	1	1	1	0	2	0	0	E 16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (B) ← (A)

Grouping: Register to register transfer

Description: Transfers the contents of register A to register B.

TDA (Transfer data to register D from Accumulator)

Instruction code

D9									D0				
0	0	0	0	1	0	1	0	0	1	2	0	2	9 16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (DR_2–DR_0) ← (A_2–A_0)

Grouping: Register to register transfer

Description: Transfers the contents of the low-order 3 bits (A_2–A_0) of register A to register D.

TEAB (Transfer data to register E from Accumulator and register B)

Instruction code

D9									D0				
0	0	0	0	0	1	1	0	1	0	2	0	1	A 16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (E_7–E_4) ← (B)
(E_3–E_0) ← (A)

Grouping: Register to register transfer

Description: Transfers the contents of register B to the high-order 4 bits (E_7–E_4) of register E, and the contents of register A to the low-order 4 bits (E_3–E_0) of register E.

TFR0A (Transfer data to register FR0 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	1	0	1	0	0	0	2	2	2	8 16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (FR0) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to the port output structure control register FR0.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TFR1A (Transfer data to register FR1 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	1	0	1	0	0	1	2	2	9

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (FR1) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to the port output structure control register FR1.

TFR2A (Transfer data to register FR2 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	1	0	1	0	1	0	2	2	A

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (FR2) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to the port output structure control register FR2.

TI1A (Transfer data to register I1 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	1	1	1	2	1	7

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (I1) ← (A)

Grouping: Interrupt operation

Description: Transfers the contents of register A to interrupt control register I1.

TI2A (Transfer data to register I2 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	1	0	0	0	2	1	8

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (I2) ← (A)

Grouping: Interrupt operation

Description: Transfers the contents of register A to interrupt control register I2.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TK0A (Transfer data to register K0 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	1	0	1	1	2	1	B

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (K0) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to key-on wakeup control register K0.

TK1A (Transfer data to register K1 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	1	0	0	2	1	4

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (K1) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to key-on wakeup control register K1.

TK2A (Transfer data to register K2 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	1	0	1	2	1	5

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (K2) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to key-on wakeup control register K2.

TL1A (Transfer data to register L1 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	0	1	0	1	0	2	0	A

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (L1) ← (A)

Grouping: LCD operation

Description: Transfers the contents of register A to LCD control register L1.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TL2A (Transfer data to register L2 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	0	1	0	1	1	2	0	B

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (L2) ← (A)

Grouping: LCD operation

Description: Transfers the contents of register A to LCD control register L2.

TL3A (Transfer data to register L3 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	0	1	1	0	0	2	0	C

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (L3) ← (A)

Grouping: LCD operation

Description: Transfers the contents of register A to LCD control register L3.

TLCA (Transfer data to timer LC and register RLC from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	0	1	1	0	1	2	0	D

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (LC) ← (A)
(RLC) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer LC and reload register RLC.

TMA j (Transfer data to Memory from Accumulator)

Instruction code

D9									D0			
1	0	1	0	1	1	j	j	j	j	2	B	j

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (M(DP)) ← (A)
(X) ← (X)EXOR(j)
j = 0 to 15

Grouping: RAM to register transfer

Description: After transferring the contents of register A to M(DP), an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TMRA (Transfer data to register MR from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	1	1	0	2	1	6

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (MR) ← (A)

Grouping: Other operation

Description: Transfers the contents of register A to clock control register MR.

TPAA (Transfer data to register PA from Accumulator)

Instruction code

D9									D0			
1	0	1	0	1	0	1	0	1	0	2	A	A

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PA_0) ← (A_0)

Grouping: Timer operation

Description: Transfers the contents of lowermost bit (A_0) register A to timer control register PA.

TPSAB (Transfer data to Pre-Scaler from Accumulator and register B)

Instruction code

D9									D0			
1	0	0	0	1	1	0	1	0	1	2	3	5

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation:
(RPS_7–RPS_4) ← (B)
(TPS_7–TPS_4) ← (B)
(RPS_3–RPS_0) ← (A)
(TPS_3–TPS_0) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits of prescaler and prescaler reload register RPS, and transfers the contents of register A to the low-order 4 bits of prescaler and prescaler reload register RPS.

TPU0A (Transfer data to register PU0 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	1	0	1	1	0	1	2	2	D

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PU0) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to pull-up control register PU0.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TPU1A (Transfer data to register PU1 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	1	0	1	1	1	0	2	2	E	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (PU1) ← (A)

Grouping: Input/Output operation

Description: Transfers the contents of register A to pull-up control register PU1.

TR1AB (Transfer data to register R1 from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	1	1	1	1	2	3	F	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: ($R1_7$–$R1_4$) ← (B)
($R1_3$–$R1_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits ($R1_7$–$R1_4$) of reload register R1, and the contents of register A to the low-order 4 bits ($R1_3$–$R1_0$) of reload register R1.

TR3AB (Transfer data to register R3 from Accumulator and register B)

Instruction code

D9									D0				
1	0	0	0	1	1	1	0	1	1	2	3	B	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: ($R3_7$–$R3_4$) ← (B)
($R3_3$–$R3_0$) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register B to the high-order 4 bits ($R3_7$–$R3_4$) of reload register R3, and the contents of register A to the low-order 4 bits ($R3_3$–$R3_0$) of reload register R3.

TV1A (Transfer data to register V1 from Accumulator)

Instruction code

D9									D0				
0	0	0	0	1	1	1	1	1	1	0	3	F	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (V1) ← (A)

Grouping: Interrupt operation

Description: Transfers the contents of register A to interrupt control register V1.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TV2A (Transfer data to register V2 from Accumulator)

Instruction code

D9									D0				
0	0	0	0	1	1	1	1	1	0	2	0	3	E 16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (V2) ← (A)

Grouping: Interrupt operation

Description: Transfers the contents of register A to interrupt control register V2.

TW1A (Transfer data to register W1 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	0	0	1	1	1	0	2	0	E	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W1) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W1.

TW2A (Transfer data to register W2 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	0	0	1	1	1	1	2	0	F	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W2) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W2.

TW3A (Transfer data to register W3 from Accumulator)

Instruction code

D9									D0				
1	0	0	0	0	1	0	0	0	0	2	1	0	16

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W3) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W3.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

TW4A (Transfer data to register W4 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	0	0	1	2	1	1

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W4) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W4.

TW5A (Transfer data to register W5 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	0	1	0	2	1	2

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W5) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W5.

TW6A (Transfer data to register W6 from Accumulator)

Instruction code

D9									D0			
1	0	0	0	0	1	0	0	1	1	2	1	3

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (W6) ← (A)

Grouping: Timer operation

Description: Transfers the contents of register A to timer control register W6.

TYA (Transfer data to register Y from Accumulator)

Instruction code

D9									D0			
0	0	0	0	0	0	1	1	0	0	0	0	C

$_2$ $_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (Y) ← (A)

Grouping: Register to register transfer

Description: Transfers the contents of register A to register Y.

MACHINE INSTRUCTIONS (INDEX BY ALPHABET) (continued)

WRST (Watchdog timer ReSeT)

Instruction code

D9									D0				
1	0	1	0	1	0	0	0	0	0	2	A	0	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(WDF1) = 1

Operation: (WDF1) = 1 ?
After skipping, (WDF1) ← 0

Grouping: Other operation

Description: Skips the next instruction when watchdog timer flag WDF1 is "1." After skipping, clears (0) to the WDF1 flag. When the WDF1 flag is "0," executes the next instruction. Also, stops the watchdog timer function when executing the WRST instruction immediately after the DWDT instruction.

XAM j (eXchange Accumulator and Memory data)

Instruction code

D9									D0				
1	0	1	1	0	1	j	j	j	j	2	D	j	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	–

Operation: (A) ←→ (M(DP))
(X) ← (X)EXOR(j)
j = 0 to 15

Grouping: RAM to register transfer

Description: After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.

XAMD j (eXchange Accumulator and Memory data and Decrement register Y and skip)

Instruction code

D9									D0				
1	0	1	1	1	1	j	j	j	j	2	F	j	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(Y) = 15

Operation: (A) ←→ (M(DP))
(X) ← (X)EXOR(j)
j = 0 to 15
(Y) ← (Y) – 1

Grouping: RAM to register transfer

Description: After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.
Subtracts 1 from the contents of register Y. As a result of subtraction, when the contents of register Y is 15, the next instruction is skipped. When the contents of register Y is not 15, the next instruction is executed.

XAMI j (eXchange Accumulator and Memory data and Increment register Y and skip)

Instruction code

D9									D0				
1	0	1	1	1	0	j	j	j	j	2	E	j	
									$_2$				$_{16}$

Number of words	Number of cycles	Flag CY	Skip condition
1	1	–	(Y) = 0

Operation: (A) ←→ (M(DP))
(X) ← (X)EXOR(j)
j = 0 to 15
(Y) ← (Y) + 1

Grouping: RAM to register transfer

Description: After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.
Adds 1 to the contents of register Y. As a result of addition, when the contents of register Y is 0, the next instruction is skipped. when the contents of register Y is not 0, the next instruction is executed.

Skip condition	Carry flag CY	Datailed description
–	–	Transfers the contents of register B to register A.
–	–	Transfers the contents of register A to register B.
–	–	Transfers the contents of register Y to register A.
–	–	Transfers the contents of register A to register Y.
–	–	Transfers the contents of register B to the high-order 4 bits (E_7–E_4) of register E, and the contents of register A to the low-order 4 bits (E_3–E_0) of register E.
–	–	Transfers the high-order 4 bits (E_7–E_4) of register E to register B, and low-order 4 bits (E_3–E_0) of register E to register A.
–	–	Transfers the contents of the low-order 3 bits (A_2–A_0) of register A to register D.
–	–	Transfers the contents of register D to the low-order 3 bits (A_2–A_0) of register A.
–	–	Transfers the contents of register Z to the low-order 2 bits (A_1, A_0) of register A.
–	–	Transfers the contents of register X to register A.
–	–	Transfers the contents of stack pointer (SP) to the low-order 3 bits (A_2–A_0) of register A.
Continuous description	–	Loads the value x in the immediate field to register X, and the value y in the immediate field to register Y. When the LXY instructions are continuously coded and executed, only the first LXY instruction is executed and other LXY instructions coded continuously are skipped.
–	–	Loads the value z in the immediate field to register Z.
(Y) = 0	–	Adds 1 to the contents of register Y. As a result of addition, when the contents of register Y is 0, the next instruction is skipped. When the contents of register Y is not 0, the next instruction is executed.
(Y) = 15	–	Subtracts 1 from the contents of register Y. As a result of subtraction, when the contents of register Y is 15, the next instruction is skipped. When the contents of register Y is not 15, the next instruction is executed.
–	–	After transferring the contents of M(DP) to register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.
–	–	After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.
(Y) = 15	–	After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X. Subtracts 1 from the contents of register Y. As a result of subtraction, when the contents of register Y is 15, the next instruction is skipped. When the contents of register Y is not 15, the next instruction is executed.
(Y) = 0	–	After exchanging the contents of M(DP) with the contents of register A, an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X. Adds 1 to the contents of register Y. As a result of addition, when the contents of register Y is 0, the next instruction is skipped. When the contents of register Y is not 0, the next instruction is executed.
–	–	After transferring the contents of register A to M(DP), an exclusive OR operation is performed between register X and the value j in the immediate field, and stores the result in register X.

Skip condition	Carry flag CY	Datailed description
Continuous description	–	Loads the value n in the immediate field to register A. When the LA instructions are continuously coded and executed, only the first LA instruction is executed and other LA instructions coded continuously are skipped.
–	–	Transfers bits 7 to 4 to register B and bits 3 to 0 to register A. These bits 7 to 0 are the ROM pattern in address $(DR_2\ DR_1\ DR_0\ A_3\ A_2\ A_1\ A_0)_2$ specified by registers A and D in page p. When this instruction is executed, be careful not to over the stack because 1 stage of stack register is used. The pages which can be referred as follows; after the SBK instruction: 64 to 127 after the RBK instruction: 0 to 63 after system is released from reset or returned from power down: 0 to 63.
–	–	Adds the contents of M(DP) to register A. Stores the result in register A. The contents of carry flag CY remains unchanged.
–	0/1	Adds the contents of M(DP) and carry flag CY to register A. Stores the result in register A and carry flag CY.
Overflow = 0	–	Adds the value n in the immediate field to register A, and stores a result in register A. The contents of carry flag CY remains unchanged. Skips the next instruction when there is no overflow as the result of operation. Executes the next instruction when there is overflow as the result of operation.
–	–	Takes the AND operation between the contents of register A and the contents of M(DP), and stores the result in register A.
–	–	Takes the OR operation between the contents of register A and the contents of M(DP), and stores the result in register A.
–	1	Sets (1) to carry flag CY.
–	0	Clears (0) to carry flag CY.
(CY) = 0	–	Skips the next instruction when the contents of carry flag CY is “0.”
–	–	Stores the one’s complement for register A’s contents in register A.
–	0/1	Rotates 1 bit of the contents of register A including the contents of carry flag CY to the right.
–	–	Sets (1) the contents of bit j (bit specified by the value j in the immediate field) of M(DP).
–	–	Clears (0) the contents of bit j (bit specified by the value j in the immediate field) of M(DP).
(Mj(DP)) = 0 j = 0 to 3	–	Skips the next instruction when the contents of bit j (bit specified by the value j in the immediate field) of M(DP) is “0.” Executes the next instruction when the contents of bit j of M(DP) is “1.”
(A) = (M(DP))	–	Skips the next instruction when the contents of register A is equal to the contents of M(DP). Executes the next instruction when the contents of register A is not equal to the contents of M(DP).
(A) = n	–	Skips the next instruction when the contents of register A is equal to the value n in the immediate field. Executes the next instruction when the contents of register A is not equal to the value n in the immediate field.

Skip condition	Carry flag CY	Datailed description
$V1_2$ = 0: (T1F) = 1	–	Skips the next instruction when the contents of bit 2 ($V1_2$) of interrupt control register V1 is “0” and the contents of T1F flag is “1.” After skipping, clears (0) to T1F flag.
$V1_3$ = 0: (T2F) =1	–	Skips the next instruction when the contents of bit 3 ($V1_3$) of interrupt control register V1 is “0” and the contents of T2F flag is “1.” After skipping, clears (0) to T2F flag.
$V2_0$ = 0: (T3F) = 1	–	Skips the next instruction when the contents of bit 0 ($V2_0$) of interrupt control register V2 is “0” and the contents of T3F flag is “1.” After skipping, clears (0) to T3F flag.
$V2_3$ = 0: (T4F) =1	–	Skips the next instruction when the contents of bit 3 ($V2_3$) of interrupt control register V2 is “0” and the contents of T4F flag is “1.” After skipping, clears (0) to T4F flag.
$V2_1$ = 0: (T5F) =1	–	Skips the next instruction when the contents of bit 1 ($V2_1$) of interrupt control register V2 is “0” and the contents of T5F flag is “1.” After skipping, clears (0) to T5F flag.
–	–	Transfers the input of port P0 to register A.
–	–	Outputs the contents of register A to port P0.
–	–	Transfers the input of port P1 to register A.
–	–	Outputs the contents of register A to port P1.
–	–	Transfers the input of port P2 to register A.
–	–	Transfers the input of port P3 to register A.
–	–	Sets (1) to all port D.
–	–	Clears (0) to a bit of port D specified by register Y.
–	–	Sets (1) to a bit of port D specified by register Y.
(D(Y)) = 0 However, (Y)=0 to 7	–	Skips the next instruction when a bit of port D specified by register Y is “0.” Executes the next instruction when a bit of port D specified by register Y is “1.”
–	–	Clears (0) to port C.
–	–	Sets (1) to port C.
–	–	Transfers the contents of pull-up control register PU0 to register A.
–	–	Transfers the contents of register A to pull-up control register PU0.
–	–	Transfers the contents of pull-up control register PU1 to register A.
–	–	Transfers the contents of register A to pull-up control register PU1.

	SVDE	1	0	1	0	0	1	0	0	1	1	2 9 3	1	1	At power down mode, voltage drop detection circuit valid

Note: * (SBK, RBK) cannot be used in the M34554M8.
The pages which can be referred by the TABP instruction after the SBK instruction is executed are 64 to 95 in the M34554MC.

Skip condition	Carry flag CY	Datailed description
–	–	Transfers the contents of key-on wakeup control register K0 to register A.
–	–	Transfers the contents of register A to key-on wakeup control register K0.
–	–	Transfers the contents of key-on wakeup control register K1 to register A.
–	–	Transfers the contents of register A to key-on wakeup control register K1.
–	–	Transfers the contents of key-on wakeup control register K2 to register A.
–	–	Transfers the contents of register A to key-on wakeup control register K2.
–	–	Transferts the contents of register A to port output format control register FR0.
–	–	Transferts the contents of register A to port output format control register FR1.
–	–	Transferts the contents of register A to port output format control register FR2.
–	–	Transfers the contents of LCD control register L1 to register A.
–	–	Transfers the contents of register A to LCD control register L1.
–	–	Transfers the contents of register A to LCD control register L2.
–	–	Transfers the contents of register A to LCD control register L3.
–	–	Selects the ceramic resonator for main clock, stops the on-chip oscillator (internal oscillator).
–	–	Selects the RC oscillation circuit for main clock, stops the on-chip oscillator (internal oscillator).
–	–	Transfers the contents of clock control regiser MR to register A.
–	–	Transfers the contents of register A to clock control register MR.
–	–	No operation; Adds 1 to program counter value, and others remain unchanged.
–	–	Puts the system in clock operating mode by executing the POF instruction after executing the EPOF instruction.
–	–	Puts the system in RAM back-up state by executing the POF2 instruction after executing the EPOF instruction.
–	–	Makes the immediate after POF or POF2 instruction valid by executing the EPOF instruction.
(P) = 1	–	Skips the next instruction when the P flag is “1”. After skipping, the P flag remains unchanged.
(WDF1) = 1	–	Skips the next instruction when watchdog timer flag WDF1 is “1.” After skipping, clears (0) to the WDF1 flag. Also, stops the watchdog timer function when executing the WRST instruction immediately after the DWDT instruction.
–	–	Stops the watchdog timer function by the WRST instruction after executing the DWDT instruction.
–	–	Sets referring data area to pages 0 to 63 when the TABP p instruction is executed. This instruction is valid only for the TABP p instruction.
–	–	Sets referring data area to pages 64 to 127 when the TABP p instruction is executed. This instruction is valid only for the TABP p instruction.
–	–	Validates the voltage drop detection circuit at power down (clock operating mode and RAM back-up mode) when VDCE pin is “H”.

The above table shows the relationship between machine language codes and machine language instructions. D_3–D_0 show the low-order 4 bits of the machine language code, and D_9–D_4 show the high-order 6 bits of the machine language code. The hexadecimal representation of the code is also provided. There are one-word instructions and two-word instructions, but only the first word of each instruction is shown. Do not use code marked "–."

The codes for the second word of a two-word instruction are described below.

	The second word
BL	1p paaa aaaa
BML	1p paaa aaaa
BLA	1p pp00 pppp
BMLA	1p pp00 pppp
SEA	00 0111 nnnn
SZD	00 0010 1011

- ** (SBK and RBK instructions) cannot be used in the M34554M8.
- * cannot be used after the SBK instruction is executed in the M34554MC.
- A page referred by the TABP instruction can be switched by the SBK and RBK instructions in the M34554MC/ED.
- The pages which can be referred by the TABP instruction after the SBK instruction is executed are 64 to 95 in the M34554MC.
- The pages which can be referred by the TABP instruction after the SBK instruction is executed are 64 to 127 in the M34554ED.
  (Ex. TABP 0 → TABP 64)
- The pages which can be referred by the TABP instruction after the RBK instruction is executed are 0 to 63.
- When the SBK instruction is not used, the pages which can be referred by the TABP instruction are 0 to 63.

The above table shows the relationship between machine language codes and machine language instructions. D3–D0 show the low-order 4 bits of the machine language code, and D9–D4 show the high-order 6 bits of the machine language code. The hexadecimal representation of the code is also provided. There are one-word instructions and two-word instructions, but only the first word of each instruction is shown. Do not use code marked "–."

The codes for the second word of a two-word instruction are described below.

	The second word
BL	1p paaa aaaa
BML	1p paaa aaaa
BLA	1p pp00 pppp
BMLA	1p pp00 pppp
SEA	00 0111 nnnn
SZD	00 0010 1011

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Ratings	Unit
V_{DD}	Supply voltage		–0.3 to 6.5	V
V_I	Input voltage P0, P1, P2, P3, D_0–D_7, $\overline{RESET}$, X_{IN}, X_{CIN}, VDCE		–0.3 to V_{DD}+0.3	V
V_I	Input voltage CNTR0, CNTR1, INT0, INT1		–0.3 to V_{DD}+0.3	V
V_O	Output voltage P0, P1, D_0–D_9, $\overline{RESET}$, CNTR0, CNTR1	Output transistors in cut-off state	–0.3 to V_{DD}+0.3	V
V_O	Output voltage C, X_{OUT}, X_{COUT}		–0.3 to V_{DD}+0.3	V
V_O	Output voltage SEG_0–SEG_{31}, COM_0–COM_3		–0.3 to V_{DD}+0.3	V
P_d	Power dissipation	Ta = 25 °C	300	mW
Topr	Operating temperature range		–20 to 85	°C
Tstg	Storage temperature range		–40 to 125	°C

RECOMMENDED OPERATING CONDITIONS 1

(Mask ROM version: Ta = –20 °C to 85 °C, V_{DD} = 2 to 5.5 V, unless otherwise noted)
(One Time PROM version: Ta = –20 °C to 85 °C, V_{DD} = 2.5 to 5.5 V, unless otherwise noted)

Symbol	Parameter	Conditions		Limits			Unit
				Min.	Typ.	Max.	
V_{DD}	Supply voltage (when ceramic resonator is used)	Mask ROM version	f(STCK) ≤ 6 MHz	4		5.5	V
			f(STCK) ≤ 4.4 MHz	2.7		5.5	
			f(STCK) ≤ 2.2 MHz	2		5.5	
		One Time PROM version	f(STCK) ≤ 6 MHz	4		5.5	
			f(STCK) ≤ 4.4 MHz	2.7		5.5	
			f(STCK) ≤ 2.2 MHz	2.5		5.5

			When dividing resistor r × 2 selected		100	160	320	

Note: When RC oscillation is used, use the external 33 pF capacitor (C).

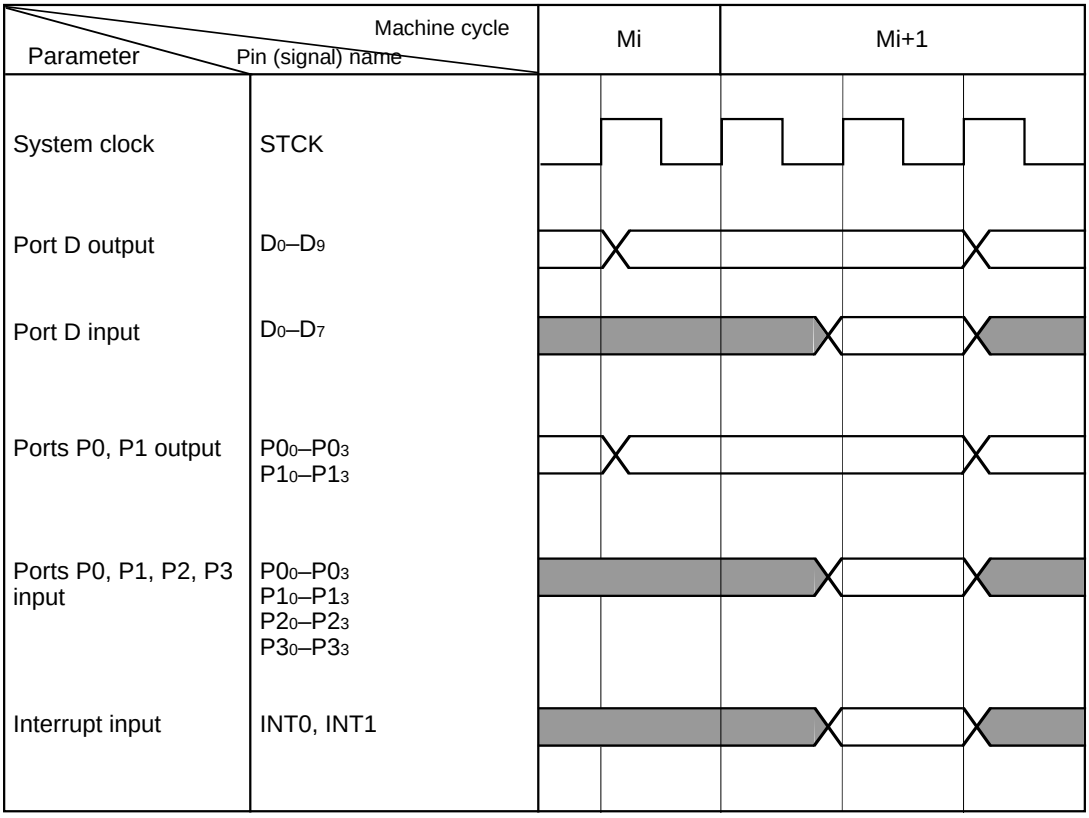
VOLTAGE DROP DETECTION CIRCUIT CHARACTERISTICS

(Ta = –20 °C to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions		Limits			Unit
				Min.	Typ.	Max.	
V_{RST}	Detection voltage (Note 1)			1.4	1.5	1.6	V
		Ta = 25 °C		1.1		1.9	
I_{RST}	Operation current	at power down	V_{DD} = 5 V		50	100	μA
		(Note 2)	V_{DD} = 3 V		30	60	
T_{RST}	Detection time	$V_{DD} \rightarrow$ (VRST–0.1 V) (Note 3)			0.2	1.2	ms

Notes 1: The detected voltage (V_{RST}) is defined as the voltage when reset occurs when the supply voltage (V_{DD}) is falling.
2: After the SVDE instruction is executed, the voltage drop detectin circuit is valid at power down mode.
3: The detection time (T_{RST}) is defined as the time until reset occurs when the supply voltage (V_{DD}) is falling to [V_{RST}–0.1 V].

BASIC TIMING DIAGRAM



BUILT-IN PROM VERSION

In addition to the mask ROM versions, the 4554 Group has the One Time PROM versions whose PROMs can only be written to and not be erased.

The built-in PROM version has functions similar to those of the mask ROM versions, but it has PROM mode that enables writing to built-in PROM.

Table 25 shows the product of built-in PROM version. Figure 61 shows the pin configurations of built-in PROM versions.

The One Time PROM version has pin-compatibility with the mask ROM version.

Table 25 Product of built-in PROM version

Part number	PROM size (× 10 bits)	RAM size (× 4 bits)	Package	ROM type
M34554EDFP	16384 words	512 words	64P6N-A	One Time PROM [shipped in blank]

PIN CONFIGURATION (TOP VIEW)

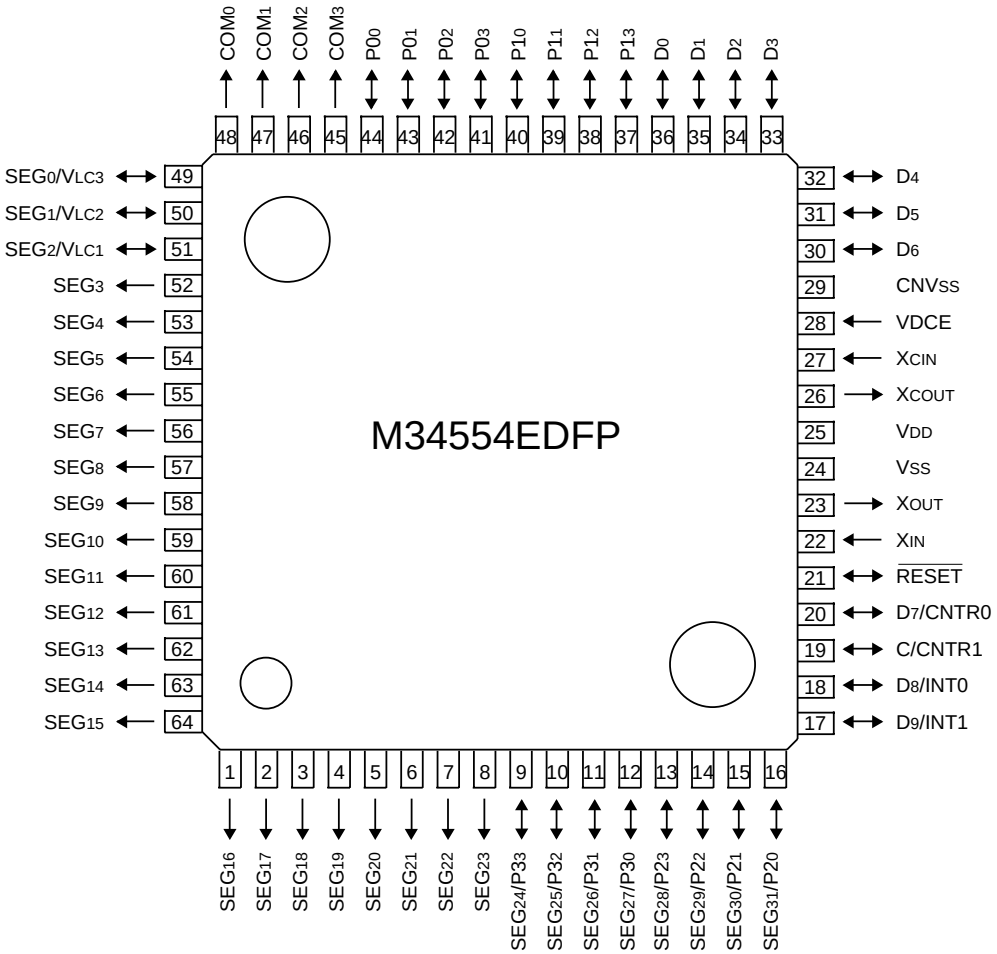


Fig. 61 Pin configuration of built-in PROM version

(1) PROM mode

The built-in PROM version has a PROM mode in addition to a normal operation mode. The PROM mode is used to write to and read from the built-in PROM.

In the PROM mode, the programming adapter can be used with a general-purpose PROM programmer to write to or read from the built-in PROM as if it were M5M27C256K.

Programming adapter is listed in Table 26. Contact addresses at the end of this data sheet for the appropriate PROM programmer.

• Writing and reading of built-in PROM

Programming voltage is 12.5 V. Write the program in the PROM of the built-in PROM version as shown in Figure 62.

(2) Notes on handling

①A high-voltage is used for writing. Take care that overvoltage is not applied. Take care especially at turning on the power.

②For the One Time PROM version shipped in blank, Renesas Technology corp. does not perform PROM writing test and screening in the assembly process and following processes. In order to improve reliability after writing, performing writing and test according to the flow shown in Figure 63 before using is recommended (Products shipped in blank: PROM contents is not written in factory when shipped).

(3) Difference between Mask ROM version and One Time PROM version

Mask ROM version and One Time PROM version have some difference of the following characteristics within the limits of an electrical property by difference of a manufacture process, built-in ROM, and a layout pattern.

• a characteristic value
• a margin of operation
• the amount of noise-proof
• noise radiation, etc.,

Accordingly, be careful of them when swithcing.

REVISION HISTORY	4554 Group Data Sheet

Rev.	Date	Description	
		Page	Summary
1.00	Nov. 27, 2001	–	First edition issued
2.00	Jul. 01, 2003	All pages	“Preliminary Notice: This is not a final specification. Some parametric limits are subject to change.” eliminated.
2.01	Sep.18, 2003	54	Note on voltage drop detection circuit added.
		55	Table 15 Port level revised.
		66	Note on voltage drop detection circuit added.
3.00	Aug. 06, 2004	All pages	Words standardized: On-chip oscillator
		4	Power dissipation: “Ta=25°C” added.
		5	Description of $\overline{\text{RESET}}$ pin revised.
		29	Fig.20: Some description added.
		30	Fig.23: Some description added.
		34	Fig.26 : Note 9 added.
		44	Some description revised.
		45	Fig.31 : “DI” instruction added.
		50	(5) LCD power supply circuit revised.
		53	Fig.40 : State of quartz-crystal oscillator added.
		57	Fig.44 : Note 5 added.
		64	Fig.56: Some description added.
		65	Fig.57: Some description added.
		66	Note on Power Source Voltage added.
