

## 1. Overview

The M32C/85 group (M32C/85, M32C/85T) microcomputer is a single-chip control unit that utilizes high-performance silicon gate CMOS technology with the M32C/80 series CPU core. The M32C/85 group (M32C/85, M32C/85T) is available in 144-pin and 100-pin plastic molded LQFP/QFP packages.

With a 16-Mbyte address space, this microcomputer combines advanced instruction manipulation capabilities to process complex instructions by less bytes and execute instructions at higher speed.

It incorporates a multiplier and DMAC adequate for office automation, communication devices and industrial equipments, and other high-speed processing applications.

### 1.1 Applications

Automobiles, audio, cameras, office equipment, communications equipment, portable equipment, etc.

## 2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU registers.

The register bank is comprised of 8 registers (R0, R1, R2, R3, A0, A1, SB and FB) out of 28 CPU registers. Two sets of register banks are provided.

Figure 2.1 CPU Register

## 2.1 General Registers

### 2.1.1 Data Registers (R0, R1, R2 and R3)

R0, R1, R2 and R3 are 16-bit registers for transfer, arithmetic and logic operations. R0 and R1 can be split into high-order bits (R0H) and low-order bits (R0L) to be used separately as 8-bit data registers. R0 can be combined with R2 to be used as a 32-bit data register (R2R0). The same applies to R1 and R3.

### 2.1.2 Address Registers (A0 and A1)

A0 and A1 are 24-bit registers for A0-/A1-indirect addressing, A0-/A1-relative addressing, transfer, arithmetic and logic operations.

### 2.1.3 Static Base Register (SB)

SB is a 24-bit register for SB-relative addressing.

### 2.1.4 Frame Base Register (FB)

FB is a 24-bit register for FB-relative addressing.

### 2.1.5 Program Counter (PC)

PC, 24 bits wide, indicates the address of an instruction to be executed.

### 2.1.6 Interrupt Table Register (INTB)

INTB is a 24-bit register indicating the starting address of an relocatable interrupt vector table.

### 2.1.7 User Stack Pointer (USP), Interrupt Stack Pointer (ISP)

The stack pointers (SP), USP and ISP, are 24 bits wide each. The U flag is used to switch between USP and ISP. Refer to "2.1.8 Flag Register (FLG)" for details on the U flag. Set USP and ISP to even addresses to execute an interrupt sequence efficiently.

### 2.1.8 Flag Register (FLG)

FLG is a 16-bit register indicating a CPU state.

#### 2.1.8.1 Carry Flag (C)

The C flag indicates whether carry or borrow has occurred after executing an instruction.

#### 2.1.8.2 Debug Flag (D)

The D flag is for debug only. Set to "0".

#### 2.1.8.3 Zero Flag (Z)

The Z flag is set to "1" when the value of zero is obtained from an arithmetic calculation; otherwise "0".

#### 2.1.8.4 Sign Flag (S)

The S flag is set to "1" when a negative value is obtained from an arithmetic calculation; otherwise "0".

### 2.1.8.5 Register Bank Select Flag (B)

The register bank 0 is selected when the B flag is set to "0". The register bank 1 is selected when this flag is set to "1".

### 2.1.8.6 Overflow Flag (O)

The O flag is set to "1" when the result of an arithmetic operation overflows; otherwise "0".

### 2.1.8.7 Interrupt Enable Flag (I)

The I flag enables a maskable interrupt.

Interrupt is disabled when the I flag is set to "0" and enabled when the I flag is set to "1". The I flag is set to "0" when an interrupt is acknowledged.

### 2.1.8.8 Stack Pointer Select Flag (U)

ISP is selected when the U flag is set to "0". USP is selected when this flag is set to "1".

The U flag is set to "0" when a hardware interrupt is acknowledged or the INT instruction of software interrupt numbers 0 to 31 is executed.

### 2.1.8.9 Processor Interrupt Priority Level (IPL)

IPL, 3 bits wide, assigns processor interrupt priority levels from level 0 to level 7.

If a requested interrupt has greater priority than IPL, the interrupt is enabled.

### 2.1.8.10 Reserved Space

When writing to a reserved space, set to "0". When reading, its content is indeterminate.

## 2.2 High-Speed Interrupt Registers

Registers associated with the high-speed interrupt are as follows:

- Flag save register (SVF)
- PC save register (SVP)
- Vector register (VCT)

## 2.3 DMAC-Associated Registers

Registers associated with DMAC are as follows:

- DMA mode register (DMD0, DMD1)
- DMA transfer count register (DCT0, DCT1)
- DMA transfer count reload register (DRC0, DRC1)
- DMA memory address register (DMA0, DMA1)
- DMA SFR address register (DSA0, DSA1)
- DMA memory address reload register (DRA0, DRA1)

### 3. Memory

Figure 3.1 shows a memory map of the M32C/85 group (M32C/85, M32C/85T).

The M32C/85 group (M32C/85, M32C/85T) provides 16-Mbyte address space from addresses 000000<sub>16</sub> to FFFFFFF<sub>16</sub>.

The internal ROM is allocated lower addresses beginning with address FFFFFFF<sub>16</sub>. For example, a 64-Kbyte internal ROM is allocated addresses FF0000<sub>16</sub> to FFFFFFF<sub>16</sub>.

The fixed interrupt vectors are allocated addresses FFFFDC<sub>16</sub> to FFFFFFF<sub>16</sub>. It stores the starting address of each interrupt routine.

The internal RAM is allocated higher addresses beginning with address 000400<sub>16</sub>. For example, a 10-Kbyte internal RAM is allocated addresses 000400<sub>16</sub> to 002BFF<sub>16</sub>. Besides storing data, it becomes stacks when the subroutine is called or an interrupt is acknowledged.

SFR, consisting of control registers for peripheral functions such as I/O port, A/D conversion, serial I/O, timers, is allocated addresses 000000<sub>16</sub> to 0003FF<sub>16</sub>. All blank spaces within SFR are reserved spaces and cannot be accessed by users.

The special page vectors are allocated addresses FFFE00<sub>16</sub> to FFFFDB<sub>16</sub>. It is used for the JMPS instruction and JSRS instruction. Refer to the Renesas publication **Software Manual** for details.

In memory expansion mode and microprocessor mode, some spaces are reserved and cannot be accessed by users.

## NOTES:

1. The BANKSEL bit in the C1CTLR1 register switches functions for addresses 02A0<sub>16</sub> to 02BF<sub>16</sub>.
2. Values are obtained by setting the SLEEP bit in the C1SLPR register to "1" (sleep mode exited) and supplying a clock to the CAN module after reset.

2.  $n$  denotes the number of block to be erased.
3. Number of program-erase cycles per block.  
If Program and Erase Endurance is  $n$  cycle ( $n \neq 100$ ), each block can be erased and programmed  $n$  cycles.  
For example, if a 4-Kbyte block A is erased after programming a word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data can not be programmed to the same address more than once without erasing the block. (Rewrite prohibited).

2. *n* denotes the number of block to be erased.
3. Number of program-erase cycles per block.  
 If Program and Erase Endurance is *n* cycle (*n*≠100), each block can be erased and programmed *n* cycles.  
 For example, if a 4-Kbyte block A is erased after programming a word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data can not be programmed to the same address more than once without erasing the block. (Rewrite prohibited).
