

## CMOS 4-BIT MICROCONTROLLER

**TMP47C457N, TMP47C857N  
TMP47C457F, TMP47C857F**

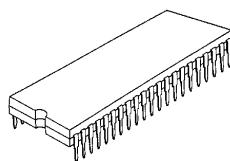

The 47C457/857 are a high-performance, 4-bit single-chip microcomputer based on the TLCS-470A CMOS series. The 47C457/857 have a build-in large-capacity RAM for repertory dial and a DTMF generator, making it ideal for application in telephones.

PART No.	ROM	RAM	PACKAGE	OTP version
TMP47C457N			SDIP42-P-600-1.78	TMP47P857VN
TMP47C457F	4096 x 8-bit	768 x 4-bit	QFP44-P-1414-0.80D	TMP47P857VF
TMP47C857N			SDIP42-P-600-1.78	TMP47P857VN

**FEATURES**

- ◆ 4-bit single-chip microcomputer
- ◆ Instruction execution time : 2.08  $\mu$ s (at 3.84MHz)  
244  $\mu$ s (at 32.8kHz)
- ◆ Low voltage operation: 2.7V min.
- ◆ 105 basic instructions
  - Table look-up instructions
- ◆ Sub-routine nesting: 15 levels max.
- ◆ 6 interruption sources (External : 2, Internal : 4)
  - All sources have independent latches, and multiple interruption control is available
- ◆ I/O port (35 pins)
  - Input 2 ports 5 pins
  - I/O 7 ports 27 pins
  - Output 1 ports 3 pins
- ◆ Two 12-bit Timer/Counters
  - Timer, event counter, and pulse-width measurement mode
- ◆ Interval Timer
- ◆ Watchdog Timer
- ◆ Serial Interface with 8-bit buffer
  - Simultaneous transmission and reception
  - External/internal clock, leading/trailing edge shift mode, 4-bit/8-bit
- ◆ DTMF (Dual-tone Multi frequency) output
  - DTMF output with one instruction
  - Single-tone output function

- For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance/Handling Precautions.
- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

## PIN ASSIGNMENTS (TOP VIEW)

## BLOCK DIAGRAM

## PIN FUNCTION

PIN NAME	Input/Output	FUNCTIONS	
K03 (HOLD3) to K00 (HOLD0)	Input (input)	4-bit input port	Hold request/release signal input (Active "H")
R33 to R30	I/O	4-bit I/O port with latch. When used as the input port, the latch must be set to "1".	
R43 to R40			
R53 to R50			
R63 to R60			
R73 (XTOUT)	I/O (Output)	When R73 or R72 is used as the oscillator, it must be set to the dual clock mode.	Osc. connecting pin (Low-frequency).
R72 (XTIN)	I/O (Input)	Setting, clearance and testing of 1-bit unit is possible by the bit processing instruction of the L-register indirect addressing.	When of external clock input, input is made to XTIN and releases XTOUT.
R71 (WTO)	I/O (Output)		Watchdog timer output
R70	I/O		
R83 (T1)	I/O (Input)	4-bit I/O port with latch. When used as the input port, external interrupt input pin or timer/counter input pin, the latch must be set to "1".	Timer/Counter 1 external input
R82 (INT1)			External interrupt 1 input
R81 (T2)			Timer/Counter 2 external input
R80 (INT2)			External interrupt 2 input
R92 (SCK)	I/O (Input and Output)	3-bit I/O port with latch. When used as an input port or serial port, the latch must be set to "1".	Serial clock I/O
R91 (SO)	I/O (Output)		Serial data output
R90 (SI)	I/O (Input)		Serial data input
P142, P141	Output	3-bit output port with latch.	BEEP output
P140 (BEEP)	Output (Output)		
TONE	Output	Tone output	
XIN	Input	Osc. connecting pin	
XOUT	Output		
RESET	Input	Reset signal input	
HOLD (KE0)	Input	Hold request/release signal input	Sense input
TEST	Input	Test pin for outgoing test. Either opened, or fixed to low level.	
VDD	Power supply	+ 2.7V to 6.0V	
VSS		0 V (GND)	

## OPERATIONAL DESCRIPTION

The configuration and function of hardware are described on the 47C457/857. Since the description emphasizes parts which differ from those on the 47C853 (TLCS-470A), make sure to also refer to the technical data for the 47C853.

### 1. SYSTEM CONFIGURATION

#### (1) Internal CPU function

With the exception of the program memory (ROM), data memory (RAM) all others are the same as those of the 47C853.

#### (2) Peripheral hardware function

- |                  |                       |
|------------------|-----------------------|
| ① I/O port       | ⑤ DTMF generator      |
| ② Interval timer | ⑥ BEEP output circuit |
| ③ Timer/Counter  | ⑦ Warm start circuit  |
| ④ Watchdog timer | ⑧ Serial interface    |

Following are descriptions of the internal CPU functions which have been added or modified to those from the 47C853, and of the peripheral hardware functions ⑤ and ⑥.

### 2. INTERNAL CPU FUNCTION

#### 2.1 Program Memory (ROM)

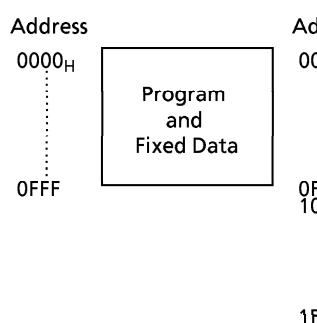

The 47C457 has a built-in program memory (mask ROM) of  $4096 \times 8 ( $0000 - 0FFF_H$  address), and the 47C857 has a built-in memory (mask ROM) of  $8192 \times 8 ( $0000 - 1FFF_H$  address).$$

The 5-8 bit data conversion table is placed in the last 32-byte space ( $0FE0 - 0FFF_H$  and  $1FE0 - 1FFF_H$  addresses, respectively) of the program memory.

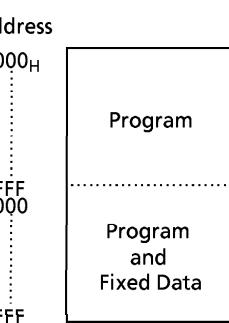

The fixed data which can be read out from the table look-up instructions are placed at the respective  $0000 - 0FFF_H$  and  $1000 - 1FFF_H$  addresses of the program memory, and address assignment is made possible by the 12-bit length data counter.

#### 2.2 Data Memory (RAM)

The 47C457 data memory (RAM) has a total of  $768 \times 4, which consists of three data memory banks (banks 0, 1, and 2) of  $256 \times 4 ( $00 - FF_H$  address). The 47C857 data memory (RAM) has a total of  $1024 \times 4, which consists of four data memory banks (banks 0, 1, 2 and 3) of  $256 \times 4 ( $00 - FF_H$  address).$$$$

1F	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Note 1. “—” means the reserved state. Unavailable for the user program.

Note 2. Automatic access to ROW and COLUMN registers by the [OUTB @HL] instruction.

Note 3. Serial interface, system clock control circuit status, and HOLD (KEO) pin input.

Note 4. HOLD control input selection, warm start control and DTMF input clock selection

Note 5. To output data to P14 output port, use "MOV A, SPW73".

Table 3-1. Port Address Assignment and Available I/O Instructions

### 3.1 DTMF Generator

The 47C457/857 has a built-in DTMF generator which generates dialing signals for tone dialing-type telephones. There are two groups of tone dial signals, one group of 4 sine wave low frequencies and another group of 4 sine wave high frequencies. All of these frequencies can be selected individually and combined with a frequency from the other group for a total of 16 different DTMF composite waves.

(DTMF : Dual-Tone Multi frequency)

#### 3.1.1 Configuration of DTMF Generator

Figure 3-1 shows the configuration of the DTMF generator.

The 47C457/857 generates two-stepped, quasi-sine waves, and outputs tone dial signals by combining the quasi-sine waves.

The high and low groups of frequencies are selected by setting the frequency selection codes in the ROW and COLUMN registers.

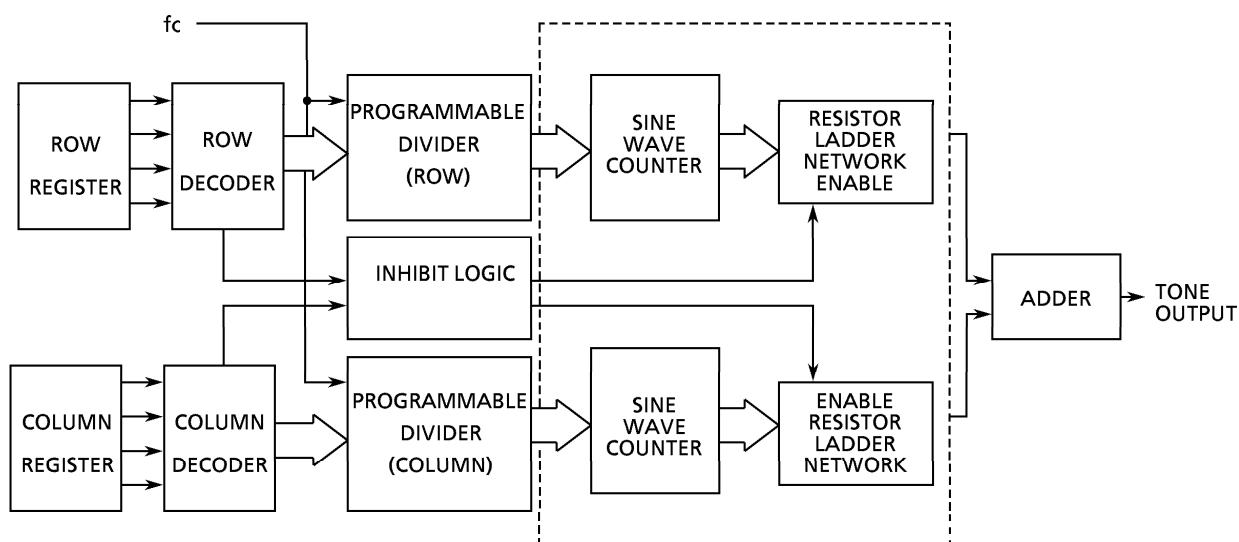

Figure 3-1. Configuration of DTMF Generator

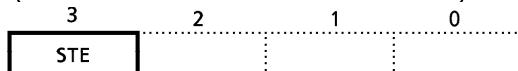

### 3.1.2 Control of DTMF Generator

Selection of frequency in tone output is controlled by the ROW register (OP01/IP01) and COLUMN register (OP02/IP02). Enable/disable of single tone output is controlled by the TONE command register (OP0D).

- Note 1. \*; don't care  
 Note 2. When reading STE bit, "1" is always read.

TONE Command Register

(Port address : OP0D Initial value : 0\*\*\*)

STE | Controls single tone output

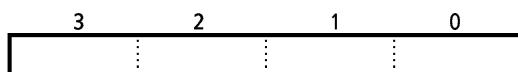

0 : Disable mode of single tone output

1 : Enable mode of single tone output

Figure 3-2. TONE Command Register

ROW register

(Port address : OP01 / IP01 Initial value : 0000)

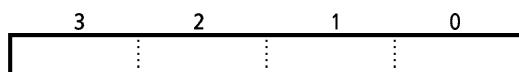

ROW tone frequency selection

- 0001 : Outputs 697.7Hz single tone
- 0010 : Outputs 769.2Hz single tone
- 0100 : Outputs 857.1Hz single tone
- 1000 : Outputs 937.5Hz single tone

COLUMN register

(Port address : OP02 / IP02 initial value : 0000)

COLUMN tone frequency selection

- 0001 : Outputs 1212.1Hz single tone
- 0010 : Outputs 1333.3Hz single tone
- 0100 : Outputs 1481.5Hz single tone
- 1000 : Outputs 1621.6Hz single tone

Figure 3-3. ROW, COLUMN Registers

Tones are outputted by entering the frequency selection codes shown in Figure 3-3. in to the ROW and COLUMN registers.

When either the ROW or COLUMN register is set with an ineffective code when the single-tone output is in the enable mode, the register's tone output enters the disable mode and only registers in which an effective code has been set will output a tone. When both registers are enabled, dual tones can be output. When the single-tone output is in the disable mode, dual tones are output only when effective codes are loaded into both the ROW and COLUMN registers. No tones are output in cases other than the preceding ones.

The [OUTB @HL] instruction can simultaneously set 8-bit data into both registers (the upper 4 bits of the ROM data in the COLUMN register, and the lower 4 bits in the ROW register).

The operation and data table for the [OUTB @HL] instructions are the same as those of the 5-8 bit conversion instructions.

Example 1 : Output of 1481.5Hz single tone (COLUMN)

```

    OUT      #8, %OP0D      ; Sets the enable mode of single tone output.
    OUT      #0, %OP01      ; Sets an ineffective code into ROW register.
    OUT      #4, %OP02      ; Sets data "4" into COLUMN register.
  
```

Example 2 : 8-bit data corresponding to the 5 bits of data which link the contents of the carry flag and the data memory RAM address 90H, are read from the ROM, and frequency selection codes are loaded into the ROW and COLUMN registers.

```

    LD      HL, #90H      ; HL ← 90H (Sets the address of the data memory)
    OUTB   @HL            ; Sets the ROM data into the ROW and COLUMN
                          ; registers.
  
```

Table 3.2 shows the deviation between the 47C457/857 tone output and standard frequencies. Table 3-3. shows the corresponding frequency selection codes of the ROW and COLUMN registers for the telephone dial keys.

ROW Tone (Low Group)						
Frequency selection code				Tone output frequency [Hz]	Standard frequency [Hz]	Deviation [%]
3	2	1	0			
0	0	0	1	697.7	697	+ 0.10
0	0	1	0	769.2	770	- 0.10
0	1	0	0	857.1	852	+ 0.60
1	0	0	0	937.5	941	- 0.37

COLUMN Tone (High Group)						
Frequency selection code				Tone output frequency [Hz]	Standard frequency [Hz]	Deviation [%]
3	2	1	0			
0	0	0	1	1212.1	1209	+ 0.26
0	0	1	0	1333.3	1336	- 0.20
0	1	0	0	1481.5	1477	+ 0.30
1	0	0	0	1621.6	1633	- 0.70

Table 3-2. Tone Output Frequencies and Deviation from Standard

COLUMN register (OP02 / IP02)				
Frequency selection code		0001 (1209)	0010 (1336)	0100 (1477)
ROW register (OP01 / IP01)	0001 (697)	1	2	3
	0010 (770)	4	5	6
	0100 (852)	7	8	9
	1000 (941)	*	0	#
Standard telephone dial key				

Contents of ( ) are standard frequencies, unit: Hz

Table 3-3. Corresponding frequency selection codes of the ROW and COLUMN registers for the telephone dial keys

### 3.1.3 Test Mode for Tone Output

The 47C457/857 includes a testing mode for checking tone output waveforms. Tones are output by the relevant circuit shown in Figure 3-4. Since ROW data are input from port R6 and COLUMN data are input from R3 using the frequency selection codes shown in Figure 3-3., an optional single tone or dual tone can be output. Figure 3-5. shows a single-tone waveform and Figure 3-6. shows a dual-tone waveform.

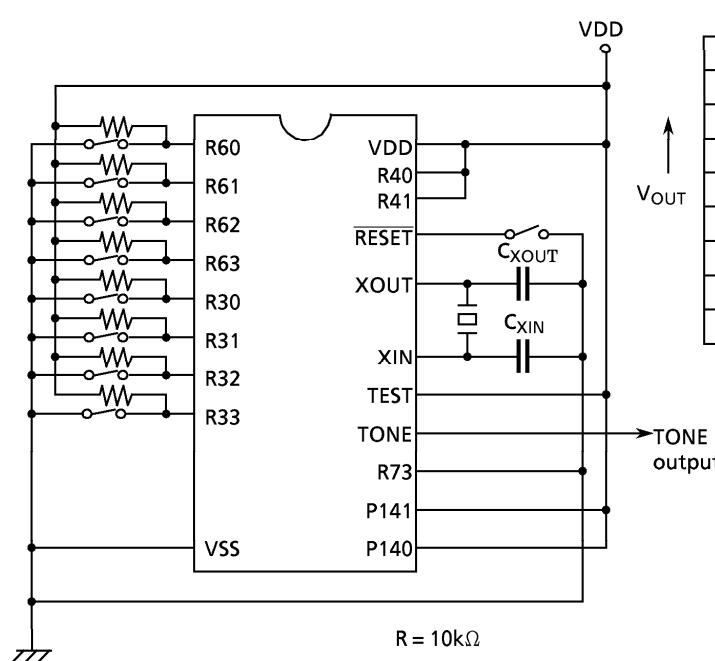

Figure 3-4. Tone Test Circuit

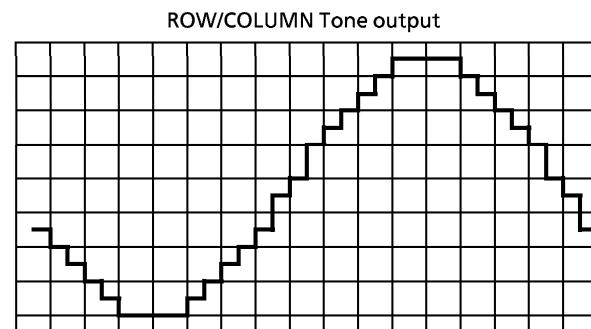

Figure 3-5. Single Tone Waveform

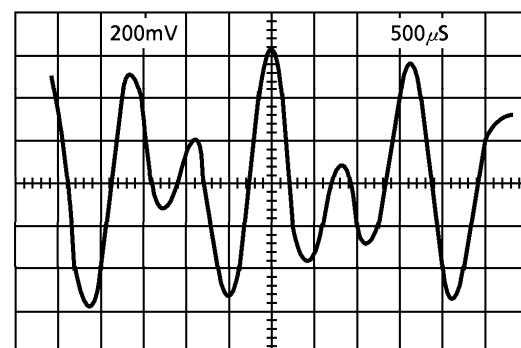

Figure 3-6. Dual Tone Waveform

### 3.2 BEEP Output Circuit

The BEEP Output circuit generates square waves in the audible frequency range. This circuit drives the key input confirmation tone regator circuit for telephone applications. The BEEP output pin is shared by the P140 output. This pin controls both P140 and BEEP output.

Adjust the P140 output latch to "1" for BEEP output.

#### 3.2.1 Configuration of BEEP Output Circuit

Figure 3-7. shows the configuration of the BEEP output circuit. The clock pulse of the BEEP output circuit is supplied from a timing generator, and the BEEP output is controlled by the frequency selection and output enable/disable setting.

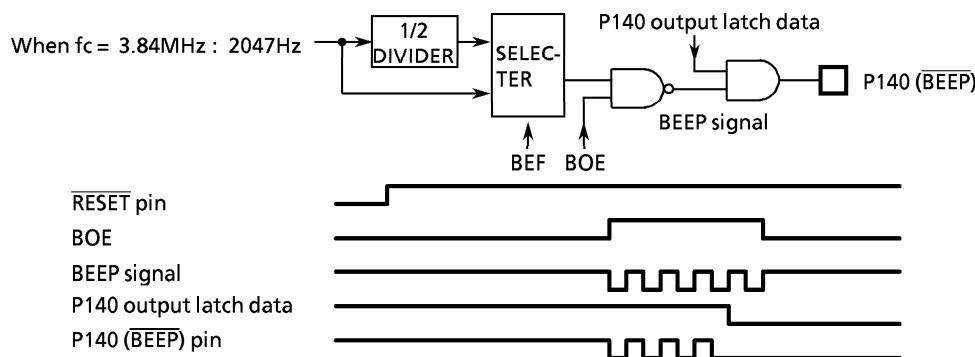

Figure 3-7. BEEP Output Circuit Configuration and Timing Chart

### 3.2.2 Control of BEEP Output Circuit

The BEEP output is controlled by the BEEP output control command register (OP13).

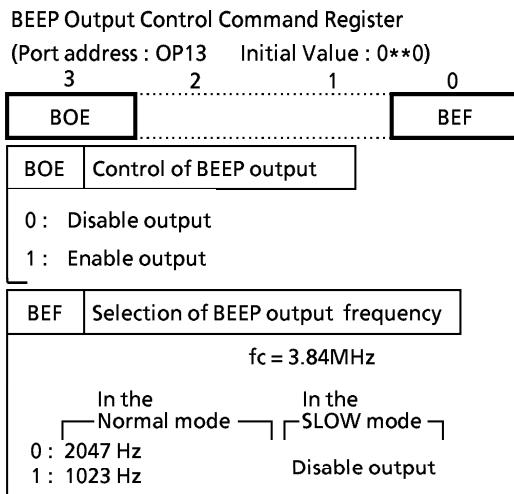

Figure 3-8. BEEP Output Control Command Register

The BEEP output is disable in the SLOW mode.

### 3.3 Warm Start Function

The reset operation is executed by adjusting the warm start control command register (Bit 3 of OP17) to "0".

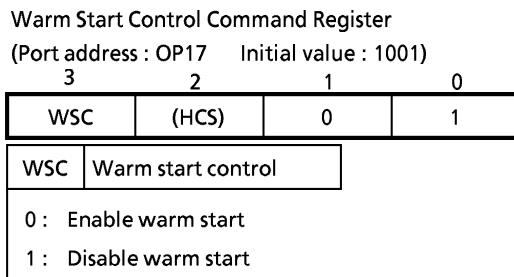

Figure 3-9. Warm Start Control Command Register

By setting WSC to "0", "L" level signal is output to a reset terminal and reset options is executed.

## Port Condition by RESET Operation

The transition of Port condition by RESET operation is shown as below.

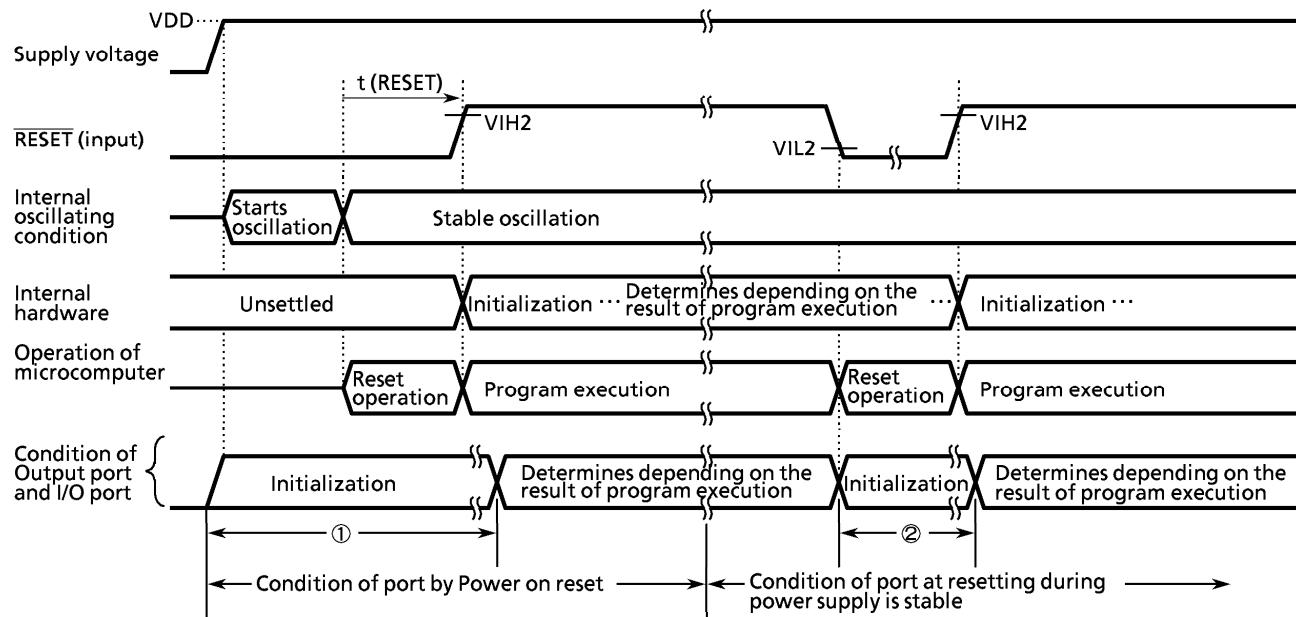

Figure 3-10. Port condition by Reset operation

**Note 1:**  $t(\text{RESET}) > 24/f_c$

**Note 2:**  $VIL2$  : Stands for low level input voltage of  $\overline{\text{RESET}}$  pin.

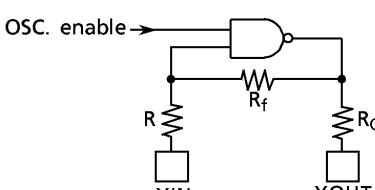

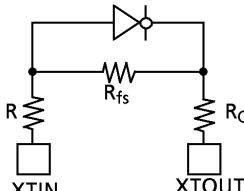

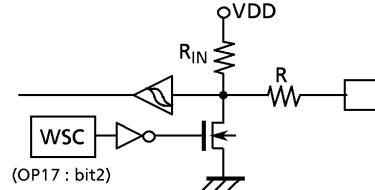

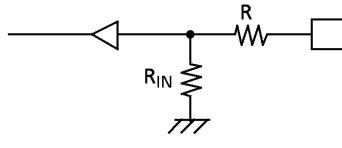

$VIH2$  : Stands for high level input voltage of  $\overline{\text{RESET}}$  pin.

**Note 3:** The term from power on reset to the time program is executed (above ①) and also the term starting from reset operation during power supply is stable to the program is executed (above ②), the port is on the initial condition. The initial condition of Port differs from I/O circuit by each port, refer to the section of "INPUT/OUTPUT CIRCUITRY". Thus, when using Port as an output pin, in the term of the above ① and ②, the voltage level on the signal that connects with the output pin of Port to the input pin of external application circuit should be determined by the external circuitry such as pull-up resistor and / or pull-down resistor.

## INPUT/OUTPUT CIRCUITRY

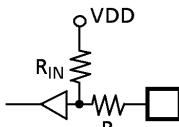

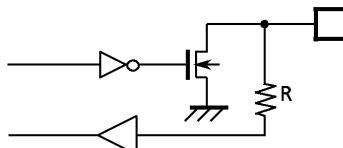

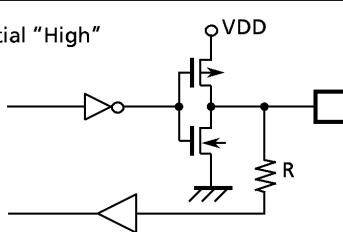

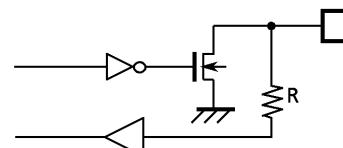

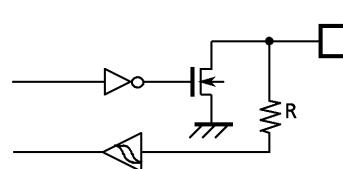

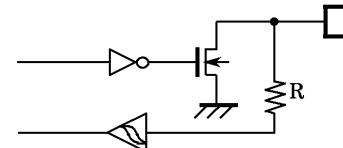

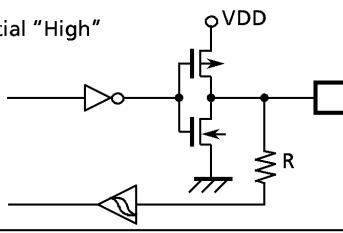

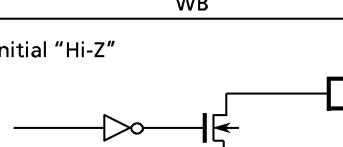

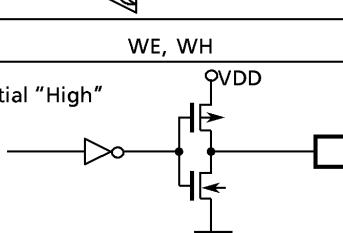

## (1) Control pins

The input/output circuitries of the 47C457/857 control pins are shown below.

CONTROL PIN	I/O	CIRCUITRY	REMARKS
XIN XOUT	Input Output		Resonator connecting pins $R = 1\text{k}\Omega$ (typ.) $R_f = 1.5\text{M}\Omega$ (typ.) $R_O = 2\text{k}\Omega$ (typ.)
XTIN XTOUT	Input Output		Resonator connecting pins $(R = 1\text{k}\Omega$ typ.) $(R_{fs} = 6\text{M}\Omega$ typ.) $(R_O = 220\text{k}\Omega$ typ.)
RESET	Input	 <small>(OP17 : bit2)</small>	Hysteresis input Pull-up resistor $R_{IN} = 220\text{k}\Omega$ (typ.) $R = 1\text{k}\Omega$ (typ.)
HOLD (KE0)	Input (Input)		Hysteresis input (Sense input) $R = 1\text{k}\Omega$ (typ.)
TEST	Input		Pull-down resistor $R_{IN} = 70\text{k}\Omega$ (typ.) $R = 1\text{k}\Omega$ (typ.)

## (2) I/O Ports

The input/output circuitries of the 47C457/857 I/O ports are shown in the following chart, any of which can be chosen by a code (WB, WE, or WH) as a mask option.

Port	I/O	INPUT/OUTPUT CIRCUITRY and CODE		REMARKS				
K0	Input			Pull-up resistor R <sub>IN</sub> = 70kΩ (typ.) R = 1kΩ (typ.)				
R3 R4 R5 R6	I/O	<table border="1"> <tr> <td style="text-align: center;">WB</td> <td style="text-align: center;">WE, WH</td> </tr> <tr> <td>Initial "Hi-Z"</td> <td>Initial "High"</td> </tr> </table> 	WB	WE, WH	Initial "Hi-Z"	Initial "High"		Sink open drain or push-pull output R = 1kΩ (typ.)

PARAMETER	SYMBOL	PINS	RATING	UNIT
Supply Voltage	V <sub>DD</sub>		- 0.3 to 7	V
Input Voltage	V <sub>IN</sub>		- 0.3 to V <sub>DD</sub> + 0.3	V
Output Voltage	V <sub>OUT1</sub>	Except sink open drain pin	- 0.3 to V <sub>DD</sub> + 0.3	V
	V <sub>OUT2</sub>	Sink open drain pin except R7	- 0.3 to 10	
Output Current (per 1 pin)	I <sub>OUT</sub>		3.2	mA
Power Dissipation [T <sub>opr</sub> = 50°C]	PD		600	mW
Soldering Temperature (time)	T <sub>sld</sub>		260 (10 s)	°C
Storage Temperature	T <sub>stg</sub>		- 55 to 125	°C
Operating Temperature	T <sub>opr</sub>		- 30 to 60	°C

RECOMMENDED OPERATING CONDITIONS (V<sub>SS</sub> = 0V, T<sub>opr</sub> = - 30 to 60°C)

PARAMETER	SYMBOL	PINS	CONDITIONS	Min.	Max.	UNIT
Supply Voltage	V <sub>DD</sub>		Normal mode	2.7	6.0	V
			SLOW mode	2.7		
			HOLD mode	2.0		
Input High Voltage	V <sub>IH1</sub>	Except hysteresis input	V <sub>DD</sub> ≥ 4.5V	V <sub>DD</sub> × 0.7	V <sub>DD</sub>	V
	V <sub>IH2</sub>	Hysteresis input		V <sub>DD</sub> × 0.75		
	V <sub>IH3</sub>		V <sub>DD</sub> < 4.5V	V <sub>DD</sub> × 0.9		
Input Low Voltage	V <sub>IL1</sub>	Except hysteresis input	V <sub>DD</sub> ≥ 4.5V	0	V <sub>DD</sub> × 0.3	V
	V <sub>IL2</sub>	Hysteresis input			V <sub>DD</sub> × 0.25	
	V <sub>IL3</sub>		V <sub>DD</sub> < 4.5V		V <sub>DD</sub> × 0.1	
Clock Frequency (High)	f <sub>c</sub>	XIN, XOUT		3.84		MHz
Clock Frequency (Low)	f <sub>s</sub>	XTIN, XTOUT		30.0	34.0	kHz

## D.C. CHARACTERISTICS

(V<sub>SS</sub> = 0V, V<sub>DD</sub> = 2.7 to 6.0V, T<sub>opr</sub> = -30 to 60°C)

PARAMETER	SYMBOL	PINS	CONDITIONS	Min.	Typ.	Max.	UNIT
Hysteresis Voltage	V <sub>HS</sub>	Hysteresis Input		—	0.7	—	V
Input Current	I <sub>IN1</sub>	Port K0, TEST RESET, HOLD	V <sub>DD</sub> = 5.5V, V <sub>IN</sub> = 5.5V/0V	—	—	±2	μA
	I <sub>IN2</sub>	Ports R (open drain)					
Input Low Current	I <sub>IL</sub>	Ports R (push-pull)	V <sub>DD</sub> = 5.5V, V <sub>IN</sub> = 0.4V	—	—	-2	mA
Input Resistance	R <sub>IN1</sub>	Port K0		30	70	150	kΩ
	R <sub>IN2</sub>	RESET		100	220	450	
Output Leakage Current	I <sub>LD</sub>	Ports P, R (open drain)	V <sub>DD</sub> = 5.5V, V <sub>OUT</sub> = 5.5V	—	—	2	μA
Output High Voltage	V <sub>OH</sub>	Ports R (push-pull)	V <sub>DD</sub> = 4.5V, I <sub>OH</sub> = -200 μA	2.4	—	—	V
Output Low Voltage	V <sub>OL2</sub>	Except XOUT	V <sub>DD</sub> = 4.5V, I <sub>OL</sub> = 1.6mA	—	—	0.4	V
Supply Current (in the Nomal mode)	I <sub>DD</sub>		Tone generating V <sub>DD</sub> = 5.5V, f <sub>c</sub> = 3.84MHz	—	3	6	mA
	I <sub>DDT</sub>		Tone generating V <sub>DD</sub> = 5.5V, f <sub>c</sub> = 3.84MHz	—	5	10	
Supply Current (in the SLOW mode)	I <sub>DDS</sub>		V <sub>DD</sub> = 3.0V, f <sub>s</sub> = 32.768kHz	—	30	60	μA
Supply Current (in the HOLD mode)	I <sub>DDH</sub>		V <sub>DD</sub> = 5.5V	—	0.5	10	μA

*Note 1. Typ. values show those at T<sub>opr</sub> = 25°C, V<sub>DD</sub> = 5V.**Note 2. Input Current I<sub>IN1</sub> : The current through resistor is not included, when containing the pull-up/pull-down resistor.**Note 3. Supply Current : V<sub>IN</sub> = 5.3V/0.2V**The K0 port is opened when containing the pull-up/pull-down resistor. The Voltage applied to the R port is within the valid range V<sub>IL</sub> or V<sub>IH</sub>.*

## TONE OUTPUT CHARACTERISTICS

(V<sub>SS</sub> = 0V, V<sub>DD</sub> = 2.7 to 6.0V, T<sub>opr</sub> = -30 to 60°C)

PARAMETER	SYMBOL	CONDITIONS	Min.	Typ.	Max.	UNIT
Tone Output Voltage (ROW)	V <sub>TONE</sub>	R <sub>L</sub> ≥ 10kΩ, V <sub>DD</sub> = 2.2V	135	200	260	mVrms
Pre-Emphasis High Band (COL / ROW)	PEHB	PEHB = 20log (COL / ROW)	1	2	3	dB
Output Distortion	DIS		—	—	10	%
Frequency Stability	△f	Except error of osc. frequency	—	—	0.7	%

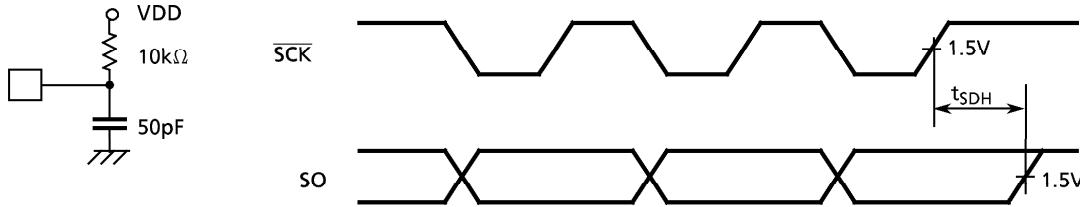

## A.C. CHARACTERISTICS

(V<sub>SS</sub> = 0V, V<sub>DD</sub> = 2.7 to 6.0V, T<sub>opr</sub> = -30 to 60°C)

PARAMETER	SYMBOL	CONDITIONS	Min.	Typ.	Max.	UNIT
Instruction Cycle Time	t <sub>cy</sub>			2.1		μs
High level clock pulse width	t <sub>WCH</sub>	External clock operation	80	—	—	ns
Low level clock pulse width	t <sub>WCL</sub>					
Shift Data Hold Time	t <sub>SDH</sub>		0.5t <sub>cy</sub> - 300	—	—	ns

**Note. Shift Data Hold Time :**

External circuit for SCK pin and SO pin.      Serial port (completion of transmission)

## RECOMMENDED OSCILLATING CONDITIONS

(V<sub>SS</sub> = 0V, V<sub>DD</sub> = 2.7 to 6.0V, T<sub>OPR</sub> = -30 to 60°C)

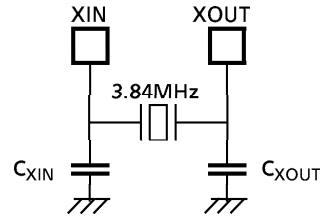

3.84MHz

Ceramic Resonator

CAS3.84MG901 (MURATA)

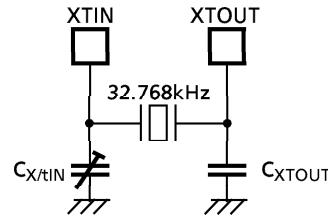

C<sub>XIN</sub> = C<sub>XOUT</sub> = 30pF

CAS3.84MGW901 (MURATA)

C<sub>XIN</sub> = C<sub>XOUT</sub> built-in

32.768kHz

Crystal Oscillator

C<sub>XTIN</sub>, C<sub>XTOUT</sub>; 10 to 33pF

**Note :** In order to get the accurate oscillation frequency, the adjustment of capacitors must be required.

## TYPICAL CHARACTERISTICS
