MC74LCX16374

Low-Voltage CMOS 16-Bit D-Type Flip-Flop

With 5 V–Tolerant Inputs and Outputs (3–State, Non–Inverting)

The MC74LCX16374 is a high performance, non–inverting 16–bit D–type flip–flop operating from a 2.3 to 3.6 V supply. The device is byte controlled. Each byte has separate Output Enable and Clock Pulse inputs. These control pins can be tied together for full 16–bit operation. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. A V_I specification of 5.5 V allows MC74LCX16374 inputs to be safely driven from 5 V devices.

The MC74LCX16374 consists of 16 edge–triggered flip–flops with individual D–type inputs and 5 V–tolerant 3–state true outputs. The buffered clocks (CPn) and buffered Output Enables ($\overline{OE}$n) are common to all flip–flops within the respective byte. The flip–flops will store the state of individual D inputs that meet the setup and hold time requirements on the LOW–to–HIGH Clock (CP) transition. With the $\overline{OE}$ LOW, the contents of the flip–flops are available at the outputs. When the $\overline{OE}$ is HIGH, the outputs go to the high impedance state. The $\overline{OE}$ input level does not affect the operation of the flip–flops.

- Designed for 2.3 to 3.6 V V_{CC} Operation
- 6.2 ns Maximum t_{pd}
- 5 V Tolerant — Interface Capability With 5 V TTL Logic
- Supports Live Insertion and Withdrawal
- I_{OFF} Specification Guarantees High Impedance When V_{CC} = 0 V
- LVTTL Compatible
- LVCMOS Compatible
- 24 mA Balanced Output Sink and Source Capability
- Near Zero Static Supply Current in All Three Logic States (20 μA) Substantially Reduces System Power Requirements
- Latchup Performance Exceeds 500 mA
- ESD Performance: Human Body Model >2000 V; Machine Model >200 V
