HEX BUS BUFFER  
 TC74VHC367 F / FN / FS / FT NON - INVERTED, 3 - STATE OUTPUTS  
 TC74VHC368 F / FN / FS / FT INVERTED, 3 - STATE OUTPUTS

The TC74VHC367 and 368 are advanced high speed CMOS HEX BUS BUFFERs fabricated with silicon gate C<sup>2</sup>MOS technology.

They achieve the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

They contain six buffers ; four buffers are controlled by an enable input ( $\bar{G}1$ ), and the other two buffers are controlled by another enable input ( $\bar{G}2$ ). The outputs of each buffer group are enabled when  $\bar{G}1$  and/or  $\bar{G}2$  inputs are held low ; if held high, these outputs are in a high impedance state.

The TC74VHC367 is a non - inverting output type, while the TC74VHC368 is an inverting output type.

An input protection circuit ensures that 0 to 7V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.
