M74HC40102

8 STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER

- HIGH SPEED :
  f_{MAX} = 38MHz (TYP.) at V_{CC} = 6V
- LOW POWER DISSIPATION:
  I_{CC} =4µA(MAX.) at T_A=25°C
- HIGH NOISE IMMUNITY:
  $V_{NIH} = V_{NIL}$ = 28 % V_{CC} (MIN.)
- SYMMETRICAL OUTPUT IMPEDANCE:
  $|I_{OH}| = I_{OL}$ = 4mA (MIN)
- BALANCED PROPAGATION DELAYS:
  $t_{PLH} \cong t_{PHL}$
- WIDE OPERATING VOLTAGE RANGE:
  V_{CC} (OPR) = 2V to 6V
- PIN AND FUNCTION COMPATIBLE WITH 74 SERIES 40102

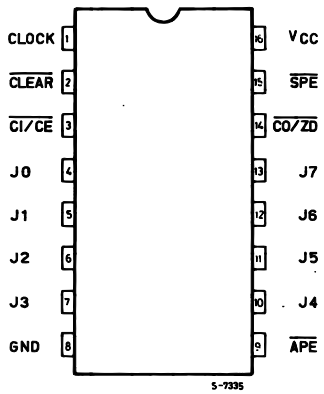
DESCRIPTION

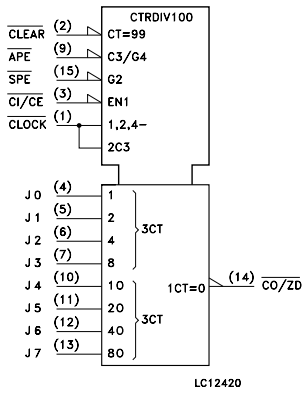
The M74HC40102 is an high speed CMOS 8-STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTER fabricated with silicon gate C^2MOS technology.

The HCF40102 consists of an 8 stage synchronous down counter with a single output which is active when the internal count is zero. The HC40102 is configured as two cascaded 4-bit BCD counters. This device has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT / ZERO DETECT output are active low logic. In normal operation the counter is decremented by one count on each positive transition of the CLOCK. Counting is inhibited when the CARRY-IN / COUNTER ENABLE ($\overline{CI}$/$\overline{CE}$) input is high. The CARRY-OUT / ZERO-DETECT ($CO/\overline{ZD}$) output goes low when the count reaches zero if the $\overline{CI}/\overline{CE}$ input is low, and remains low for one full clock period. When the SYNCHRONOUS PRESET-ENABLE ($\overline{SPE}$) input is low, data at the J input is clocked into the counter on the next positive clock transition regardless of the state of the $\overline{CI}/\overline{CE}$ input.

When the ASYNCHRONOUS PRESET-ENABLE ($\overline{APE}$) input is low, data at the J inputs is asynchronously forced into the counter regardless of the state of the $\overline{SPE}$ $\overline{CI}/\overline{CE}$ or CLOCK inputs. J input J0-J7 represent two 4-bit BCD words. When the CLEAR, $\overline{CLR}$ input is low, the counter is

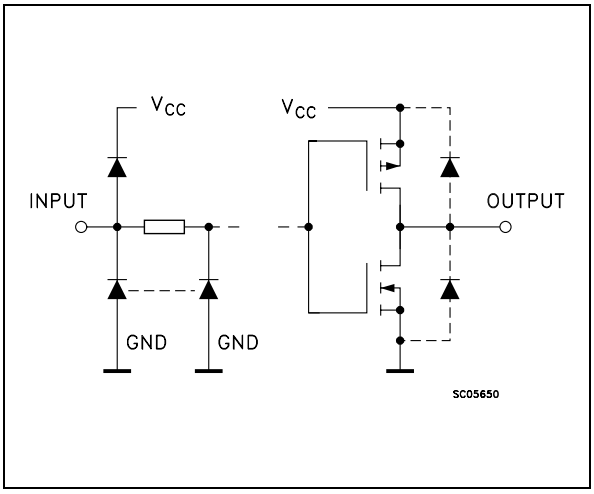
PIN CONNECTION AND IEC LOGIC SYMBOLS





asynchronously cleared to its maximum count (99_{10}) regardless of the state of any other input. The precedence relationship between control input is indicated in the truth table. If all control inputs are high at the time of zero count, the counters will jump to the maximum count giving a counting sequence of 100 clock pulses long. The HC40102 may be cascaded using the $\overline{CI/CE}$ input and the $\overline{CO/ZD}$ output, in either a synchronous or ripple mode. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

INPUT AND OUTPUT EQUIVALENT CIRCUIT



PIN DESCRIPTION

PIN No	SYMBOL	NAME AND FUNCTION
1	CLOCK	Clock Input (LOW to HIGH edge triggered)
2	$\overline{CLEAR}$	Asynchronous Master Reset Input (Active Low)
3	$\overline{CI/CE}$	Terminal Enable Input
4, 5, 6, 7, 10, 11, 12, 13	J0 to J9	Jam Inputs
9	$\overline{APE}$	Asynchronous Preset Enable Inputs(Active Low)
14	$\overline{CO/ZD}$	Terminal Count Output (Active Low)
15	$\overline{SPE}$	Synchronous Preset Enable Input (Active Low)
8	GND	Ground (0V)
16	Vcc	Positive Supply Voltage

TRUTH TABLE

CONTROL INPUTS				MODE	FUNCTIONAL DESCRIPTION
$\overline{CLEAR}$	$\overline{APE}$	$\overline{SPE}$	$\overline{CI/CE}$		
H	H	H	H	COUNT INHIBIT	EVEN IF CLOCK IS GIVEN, NO COUNT IS MADE
H	H	H	L	REGULAR COUNT	DOWN COUNT AT RISING EDGE OF CLOCK

CAPACITIVE CHARACTERISTICS

Symbol	Parameter	Test Condition		Value							Unit
		V_{CC} (V)		T_A = 25°C			-40 to 85°C		-55 to 125°C		
				Min.	Typ.	Max.	Min.	Max.	Min.	Max.	
C_{IN}	Input Capacitance	5.0			5	10		10		10	pF
C_{PD}	Power Dissipation Capacitance (note 1)	5.0			60						pF

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}$

FUNCTIONAL DESCRIPTION

This device is an 8-stage presettable synchronous down counter. Carry Out/Zero Detect ($\overline{CO/ZD}$) is output at the "L" level for the period of 1 bit when the readout becomes "0". This device adopts binary coded decimal notation, making setting up to 99 counts possible.

COUNT OPERATION

At the "H" level of control input of $\overline{CLEAR}$, $\overline{SPE}$ and $\overline{APE}$, the counter carriers out down count operation one by one at the rise of pulse given to CLOCK input. Count operation can be inhibited by setting Carry Input/Clock Enable $\overline{CI/CE}$ to the "H" level.

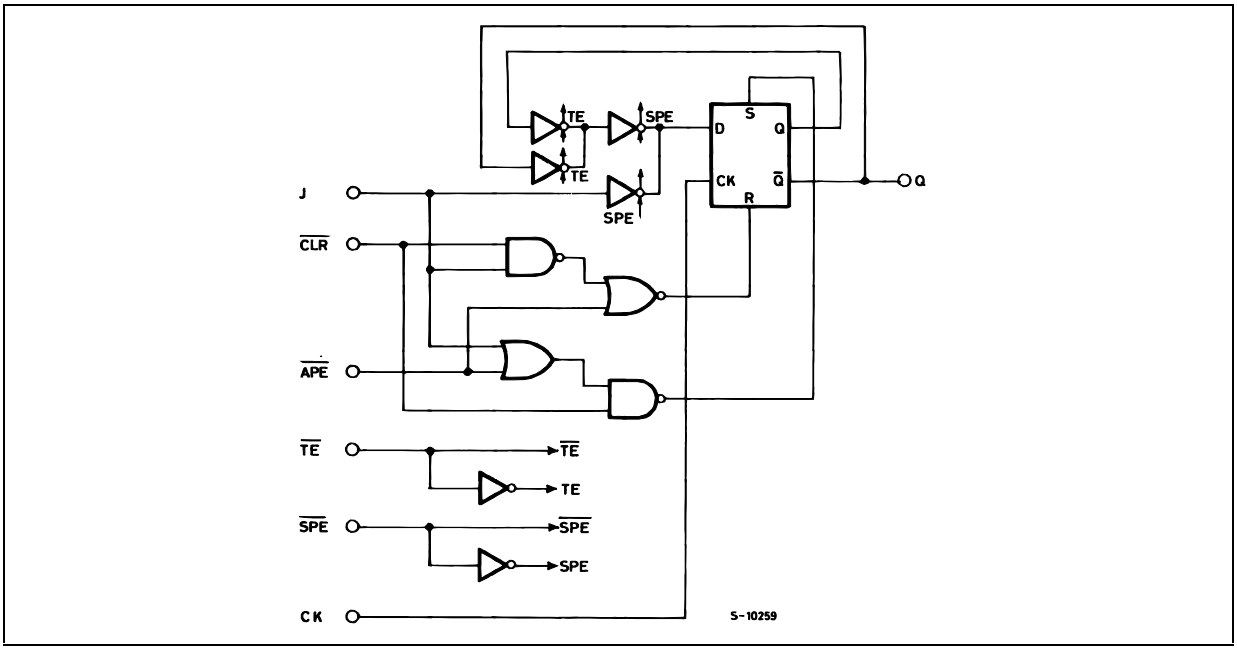
$\overline{CO/ZD}$ is output at the "L" level when the readout becomes "0" but is not output even if the readout becomes "0" when $\overline{CI/CE}$ is at the "H" level, thus maintaining the "H" level.

Synchronous cascade operation can be carried out by using $\overline{CI/CE}$ input and $\overline{CO/ZD}$ output.

The contents of count jump to maximum count (99) if clock is given when the readout is "0". Therefore, operation of 100-frequency division is carried out when clock input alone is given without various kinds of preset operation.

PRESET AND RESET OPERATION

When Clear ($\overline{CLEAR}$) input is set to the "L" level, the readout is set to the maximum count independently of other inputs. When Asynchronous Preset Enable ($\overline{APE}$) input is set to the "L" level, readouts given on J0 to J7 can be preset asynchronously to the counter independently of inputs other than $\overline{CLEAR}$ input. When Synchronous Preset Enable ($\overline{SPE}$) is set to the "L" level the readouts given on J0 to J7 can be preset to counter synchronously with the rise of clock. As to these operation mode, refer to the truth table.



INPUTS						OUTPUT
$\overline{CLEAR}$	$\overline{APE}$	$\overline{SPE}$	J	$\overline{TE}$	CLOCK	$\overline{Qn + 1}$
L	X	X	X	X	X	L

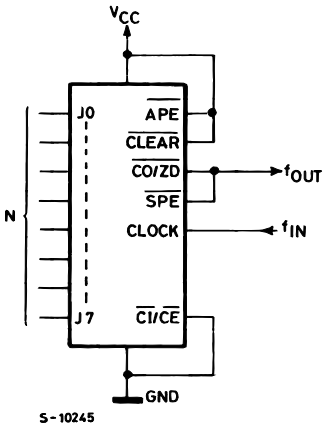
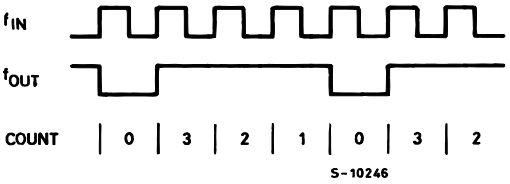
H	H	L	L	X	⌐¬	L
H	H	L	H	X	⌐¬	H
H	H	L	X	X	¬⌐	$\overline{Qn}$
H	H	H	X	L	¬⌐	Qn
H	H	H	X	H	X	$\overline{Qn}$

TYPICAL APPLICATIONS

PROGRAMMABLE DIVIDE-BY-N COUNTER

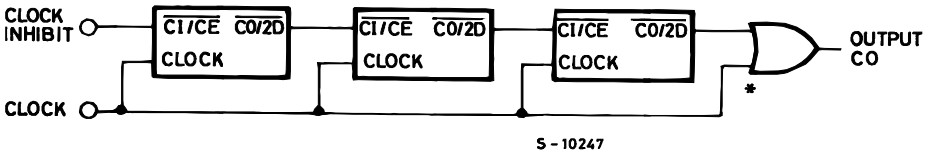


$f_{OUT} = f_{IN} / (N+1)$
Timing Chart when N = "3"
($J0, J1 = V_{CC}$, J2-J7 = GND



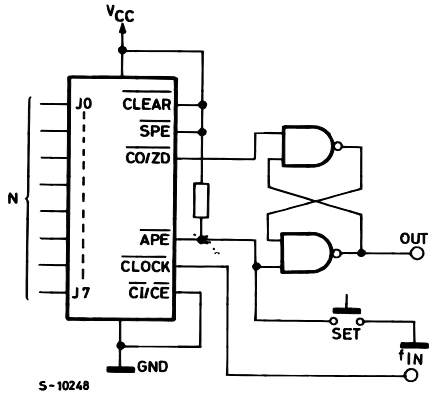
HC40102 ... 1/2 to 1/100 are dividable

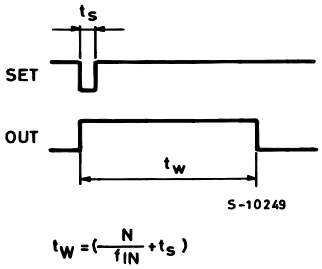
PARALLEL CARRY CASCADING



* At synchronous cascade connection, huzzerd occurs at C0 output after its second stage when digit place changes, due to delay arrival. Therefore, take gate from HC32 or the like, not from C0 output at the rear stage directly

PROGRAMMABLE TIMER

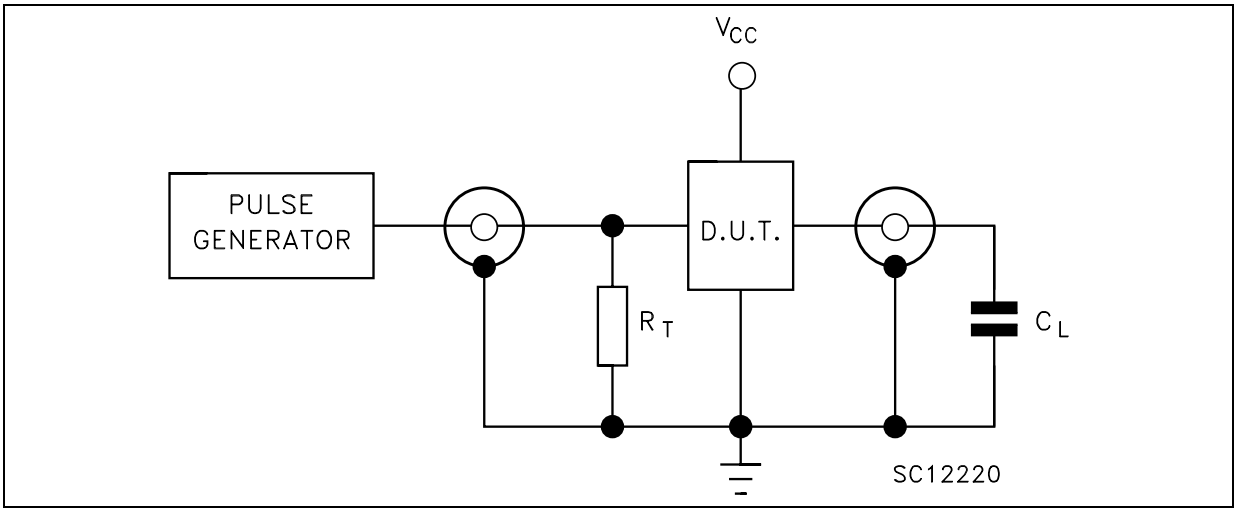




$$t_W = \left(\frac{N}{f_{IN}} + t_S\right)$$

The above formula does not take into account the phase of clock input. Therefore, the real pulse width is the distance between the above formula-$1/f_{IN}$ ~ The above formula

TEST CIRCUIT



C_L = 50pF or equivalent (includes jig and probe capacitance)
$R_T = Z_{OUT}$ of pulse generator (typically 50Ω)
