**Product Description**

The PI6C2402 features a low-skew, low-jitter, phase-locked loop (PLL) clock driver. By connecting the feedback CLK\_OUT output to the feedback FB\_IN input, the propagation delay from the CLK\_IN input to any clock output will be nearly zero. The PI6C2402 provides 2X CLK\_IN on CLK\_OUT output.

**Application**

If the system designer needs more than 16 outputs with the features just described, using two or more zero-delay buffers such as PI6C2509Q, and PI6C2510Q, is likely to be impractical. The device-to-device skew introduced can significantly reduce the performance. Pericom recommends the use of a zero-delay buffer and an eighteen output non-zero-delay buffer. As shown in Figure 1, this combination produces a zero-delay buffer with all the signal characteristics of the original zero-delay buffer, but with as many outputs as the non-zero-delay buffer part. For example, when combined with an eighteen output non-zero delay buffer, a system designer can create a seventeen-output zero-delay buffer.

### Pin Functions

Pin Name	Pin Number	Type	Description
CLK_IN	1	I	Reference Clock input. CLK_IN allows spread spectrum clock input
AV <sub>CC</sub>	2	Power	Analog power.
AGND	3	Ground	Analog ground.
CLK_OUT	4	O	Clock output. The output provides low-skew copies of CLK_IN and has an embedded series-damping resistor.
S	5	I	Control Input S. S is used to bypass the PLL for test purposes. When S is strapped to ground, PLL is bypassed and CLK_IN is buffered directly to the device outputs.
GND	6	Ground	Ground.
V <sub>CC</sub>	7	Power	Power supply.
FB_IN	8	I	Feedback input. FB_IN provides the feedback signal to the internal PLL.
