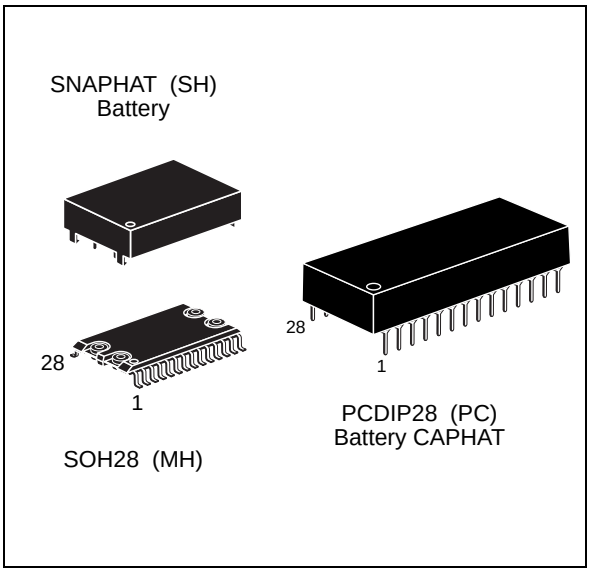
64Kb (8K x 8) ZEROPOWER® SRAM

- INTEGRATED ULTRA LOW POWER SRAM, POWER-FAIL CONTROL CIRCUIT and BATTERY
- MICROPROCESSOR POWER-ON RESET (Valid even during battery back-up mode)
- AUTOMATIC POWER-FAIL CHIP DESELECT and WRITE PROTECTION
- WRITE PROTECT VOLTAGES (V_{PFD} = Power-fail Deselect Voltage):
  - M48Z59: 4.50V ≤ V_{PFD} ≤ 4.75V
  - M48Z59Y: 4.20V ≤ V_{PFD} ≤ 4.50V
- SELF-CONTAINED BATTERY in the CAPHAT DIP PACKAGE
- PACKAGING INCLUDES a 28-LEAD SOIC and SNAPHAT® TOP (to be Ordered Separately)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION for a SNAPHAT TOP which CONTAINS the BATTERY and CRYSTAL
- PIN and FUNCTION COMPATIBLE with JEDEC STANDARD 8K x 8 SRAMs



DESCRIPTION

The M48Z59/59Y ZEROPOWER® RAM is an 8K x 8 non-volatile static RAM that integrates power-fail deselect circuitry and battery control logic on a single die. The monolithic chip is available in two special packages to provide a highly integrated battery backed-up memory solution.

Notes: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum rating conditions for extended periods of time may affect reliability.

2. Soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds).

CAUTION: *Negative undershoots below –0.3 volts are not allowed on any pin while in the Battery Back-up mode.*

CAUTION: *Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.*

DESCRIPTION (cont'd)

The M48Z59/59Y is a non-volatile pin and function equivalent to any JEDEC standard 8K x 8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special write timing or limitations on the number of writes that can be performed.

The 28 pin 600mil DIP CAPHAT™ houses the M48Z59/59Y silicon with a long life lithium button cell in a single package.

The 28 pin 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery. The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SOIC and battery packages are shipped separately in plastic anti-static tubes or in Tape & Reel form.

DESCRIPTION (cont'd)

For the 28 lead SOIC, the battery package (i.e. SNAPHAT) part number is "M4Z28-BR00SH1".

A power-on reset output provides a reset pulse to the microprocessor. The reset pulls low (open drain) an power-down and remains low on power-up for 40ms to 200ms after V_{CC} passes V_{PFD}. The M48Z59/59Y also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single 5V supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low V_{CC}. As V_{CC} falls below approximately 3V, the control circuitry connects the battery which maintains data until valid power returns.

Notes: 1. V_{PFD} (max) to V_{PFD} (min) fall time of less than t_F may result in deselection/write protection not occurring until 200 µs after V_{CC} passes V_{PFD} (min).
2. V_{PFD} (min) to V_{SO} fall time of less than t_{FB} may cause corruption of RAM data.

READ MODE

The M48Z59/59Y is in the Read Mode whenever $\overline{W}$ (Write Enable) is high, $\overline{E1}$ (Chip Enable 1) is low, and E2 (Chip Enable 2) is high. Valid data will be available at the Data I/O pins within Address Access time (t_{AVQV}) after the last address input signal is stable, providing that the $\overline{E1}$, E2, and $\overline{G}$ access times are also satisfied. If the $\overline{E1}$, E2 and $\overline{G}$ access times are not met, valid data will be available after the latter of the Chip Enable Access times (t_{E1LQV} or t_{E2HQV}) or Output Enable Access time (t_{GLQV}).

The state of the eight three-state Data I/O signals is controlled by $\overline{E1}$, E2 and $\overline{G}$. If the outputs are activated before t_{AVQV}, the data lines will be driven to an indeterminate state until t_{AVQV}. If the Address Inputs are changed while $\overline{E1}$, E2 and $\overline{G}$ remain active, output data will remain valid for Output Data Hold time (t_{AXQX}) but will go indeterminate until the next Address Access.

Figure 7. Write Enable Controlled, Write AC Waveforms

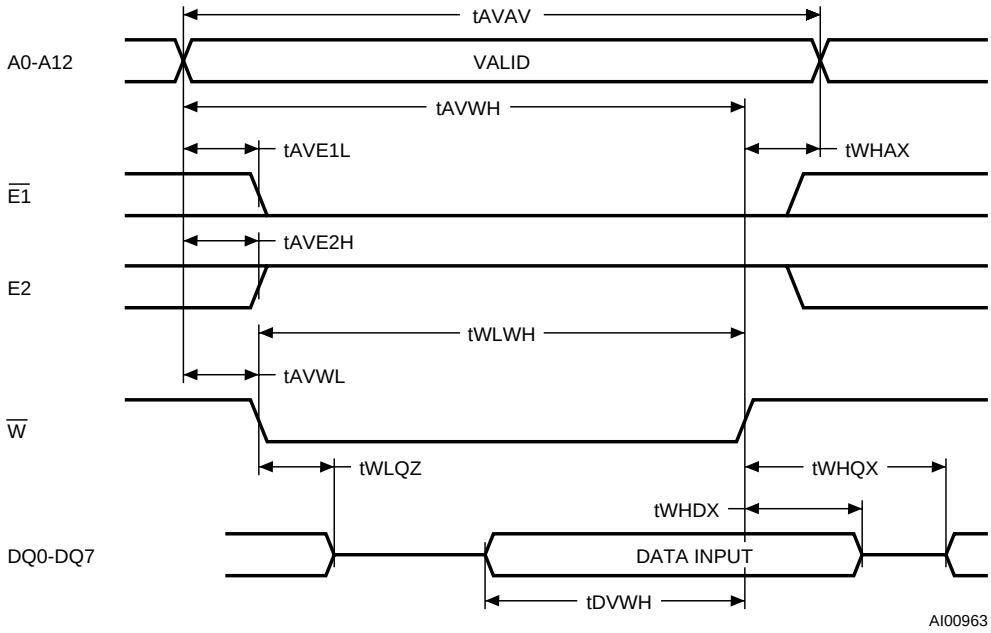

Figure 8. Chip Enable Controlled, Write AC Waveforms

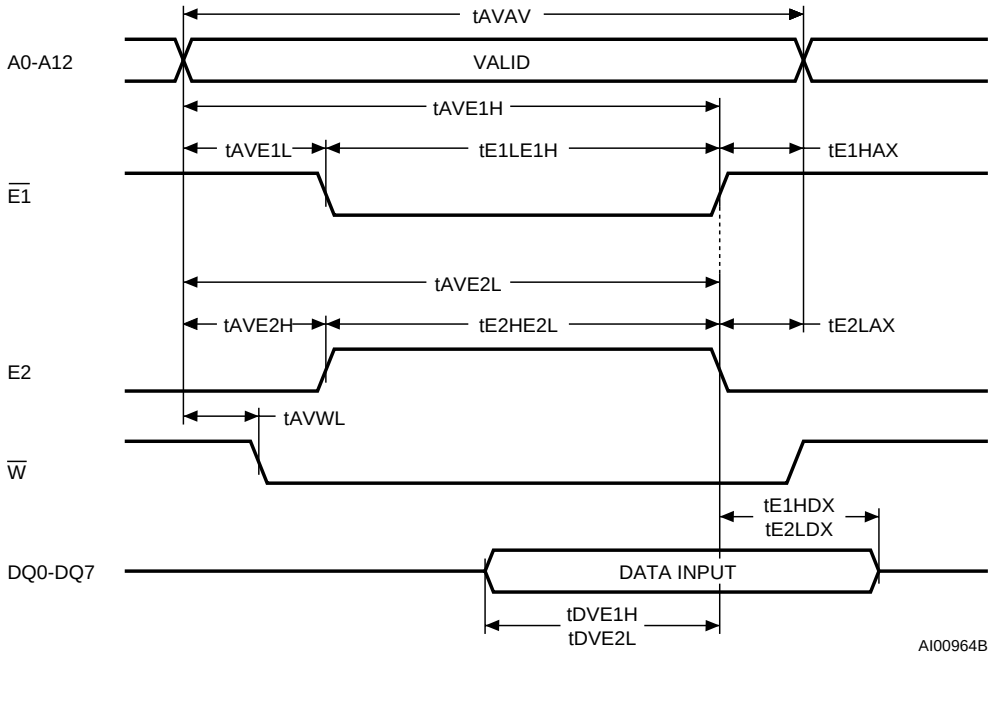

WRITE MODE

The M48Z59/59Y is in the Write Mode whenever $\overline{W}$ and $\overline{E1}$ are low and E2 is high. The start of a write is referenced from the latter occurring falling edge of $\overline{W}$ or $\overline{E1}$, or the rising edge of E2. A write is terminated by the earlier rising edge of $\overline{W}$ or $\overline{E1}$, or the falling edge of E2. The addresses must be held valid throughout the cycle. $\overline{E1}$ or $\overline{W}$ must return high or E2 low for a minimum of t_{E1HAX} or t_{E2LAX} from Chip Enable or t_{WHAX} from Write Enable prior to the initiation of another read or write cycle. Data-in must be valid t_{DVWH} prior to the end of write and remain valid for t_{WHDX} afterward. $\overline{G}$ should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on $\overline{E1}$ and $\overline{G}$ and a high on E2, a low on $\overline{W}$ will disable the outputs t_{WLQZ} after $\overline{W}$ falls.

DATA RETENTION MODE

With valid V_{CC} applied, the M48Z59/59Y operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when V_{CC} falls within the V_{PFD}(max), V_{PFD}(min) window. All outputs become high impedance, and all inputs are treated as "don't care."

Note: A power failure during a write cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM's content. At voltages below V_{PFD}(min), the user can be assured the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F. The M48Z59/59Y may respond to transient noise spikes on V_{CC} that reach into the deselect window during the time the device is sampling V_{CC}. Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO}, the control circuit switches power to the internal battery which preserves data. The internal button cell will maintain data in the M48Z59/59Y for an accumulated period of at least 10 years when V_{CC} is less than V_{SO}. As system power returns and V_{CC} rises above V_{SO}, the battery is disconnected, and the power supply is switched to external V_{CC}. Write protection continues for t_{REC} until V_{CC} reaches V_{PFD}(min). $\overline{E1}$ should be kept high or E2 low as V_{CC} rises past V_{PFD}(min) to prevent inadvertent write cycles prior to system stabilization. Normal RAM operation can resume t_{REC} after V_{CC} exceeds V_{PFD}(max).

For more information on Battery Storage Life refer to the Application Note AN1012.

POWER-ON RESET

The M48Z59/59Y continuously monitors V_{CC}. When V_{CC} falls to the power fail detect trip point, the $\overline{RST}$ pulls low (open drain) and remains low on power-up for 40ms to 200ms after V_{CC} passes V_{PFD}. A 1kΩ resistor is recommended in order to control the rise-time. The reset pulse remains active with V_{CC} at V_{SS}.

POWER SUPPLY DECOUPLING and UNDERSHOOT PROTECTION

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy, which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of 0.1µF (as shown in Figure 9) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one Volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, it is recommeded to connect a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC}, anode to V_{SS}). Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount.

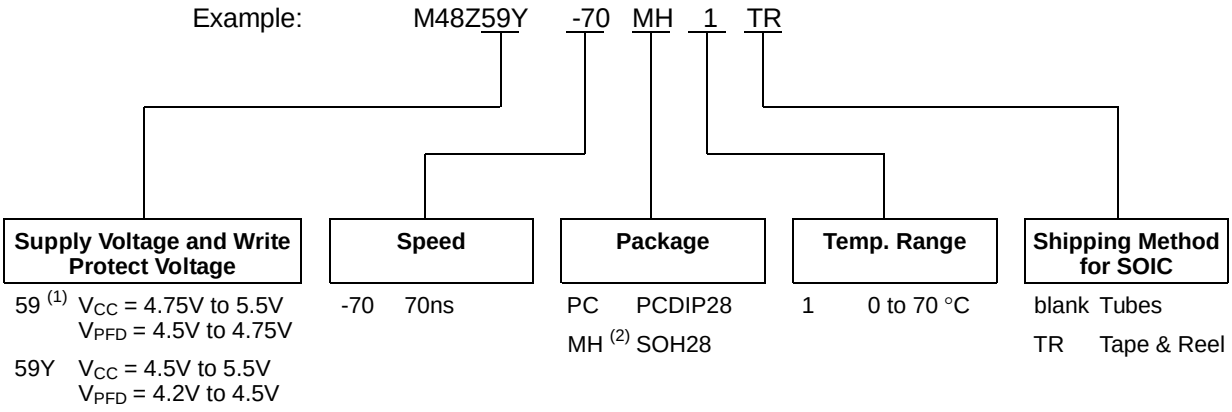
ORDERING INFORMATION SCHEME



Notes: 1. The M48Z59 part is offered with the PCDIP28 (i.e. CAPHAT) package only.
2. The SOIC package (SOH28) requires the battery package (SNAPHAT) which is ordered separately under the part number "M4Z28-BR00SH1" in plastic tube or "M4Z28-BR00SH1TR" in Tape & Reel form.

Caution: Do not place the SNAPHAT battery package "M4Z28-BR00SH1" in conductive foam since this will drain the lithium button-cell battery.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the SGS-THOMSON Sales Office nearest to you.
