DESCRIPTION

The FCT163240 is a 16-bit bus interface buffer with three-state output that is ideal for driving address and data buses. Output enables are used to enable or disable A and B ports by placing them in a high impedance condition. Easy board layout is facilitated by the use of flow-through pinouts and byte enable controls provide architectural flexibility for systems designers. All outputs have ground bounce suppression circuitry (See QSI Application Note AN-01). Multiple power and ground pins result in low ground and V_{CC} bounce. This JEDEC LVTTTL compliant 3.3V device is useful for 5V to 3.3V buffering applications, since all inputs will support 5V signals.
