DESCRIPTION

The FCT163245 16-bit transceiver is ideal for bidirectional data buffering between two buses. This device can be used as either two independent 8-bit transceivers or one 16-bit transceiver determined by the Direction and Output Enable controls. Easy board layout is facilitated by the use of flow-through pinouts. All outputs have ground bounce suppression circuitry (see QSI Application Note AN-01). Multiple power and ground pins result in low ground and V_{CC} bounce. This JEDEC LVTTL compliant 3.3V device is useful for 5V to 3.3V buffering applications, since all inputs will support 5V signals.
